I drafted a response to Neeley's letter sent to me last week, attached. Please advise if needs to go out and if so, any edits needed.

RICK SNYDER  
GOVERNOR

STATE OF MICHIGAN  
DEPARTMENT OF HEALTH AND HUMAN SERVICES  
LANSING

NICK LYON  
DIRECTOR

October 13, 2015

The Honorable Sheldon A. Neeley  
Michigan House of Representatives  
P.O. Box 30014  
Lansing, MI 48909

Dear Representative Neeley:

Thank you for your concerns, and request for information last week.

Currently, all children in Flint on Medicaid will be covered for lead testing. Further, any physician can order a lead test and this test should be covered by all health insurance programs.

Any Flint child not on Medicaid, WIC, or health insurance can get a blood lead level drawn at the Genesee County Health Department.

Sincerely,

A handwritten signature in cursive script that reads "Eden Wells".

Eden Wells, MPH, FACPM  
Chief Medical Executive  
Michigan Department of Health and Human Services

Hey. At our state board of education meeting, the question of testing Flint children for lead is being brought up...has there been any discussion about testing kids for lead levels??

Hi Lawrence,

Schools are high risk lead exposure sites, with no laws governing the exposure. See attached. I would not be surprised if you have lead in your water, especially if the fountains were turned off.

To convert mg/L to ppb, you multiply the mg/L number by 1000.  
So 0.015 mg/L = 15 ppb

Some people like to use mg/L because it makes the numbers look lower.

Marc

**Subject:** TIER 1

Good morning Dr. Edwards and Dr. Sullivan .

Dr. Edwards mentioned schools as TIER 1 plumbing site . Can you break down this classification or steer me to the info ?

Mott Children's Health Center is a 4 floor medical /dental facility for children. We have stopped using Flint water shortly after GM did to save our equipment, then covered our water fountains after the city officially announced the advisory. Our lead results are pending .

Does this TIER classification have any meaning for Mott or any similar type / size facility?  
Also the state has reported school testing for lead in mg / liter when previous reports were in ppb. I have no knowledge to convert these units for an apples to apples comparison.

Hi Hilda:

We want to make sure you have the link to our MDHHS educational materials on lead, available at [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater). Under resources you'll find posted: a parent handout; lead screening & testing information; and blood lead level guide for providers.

I'll be sure to be in touch as more and updated materials become available, but please reach out if you have any questions.

Thanks and best,

This is an informational update and the Genesee County Health Department will provide these updates on a daily basis after 4 pm. We are asking all partners included in this email to provide any pertinent updates **DAILY** to Hilda McShane by 2:00pm. If you have nothing new to share, please inform Hilda that you have no updates at this time.

- 20,000 filters + 9,000 replacement filters have been delivered to Genesee County Community Action Resource Department (GCARD) and Michigan Department Health Human Services (MDHHS).
- We are reminding partners to blackout the barcode on filter boxes before distribution.
- As of 10.13.15 Flint Housing Commission has distributed water filters to all of its housing units.
- Valley Area Agency on Aging (VAAA) is creating a list of homebound seniors. Three (3) state employees and Five (5) GCCARD employees are working through that list and will help with home installation.
- Distribution has been completed at Rosehaven Manor, Court Street Commons, Riverfront Dorms, Job Corp, and University of Michigan-Flint international student population
- Municipalities with residents that receive Flint City water will be contacted and asked to be the distribution point for the water filter system in their area by the City of Flint.
- Eileen Tomasi from Flint Schools has asked to use the elementary schools as water filter distribution points for both staff living in Flint and parents of school children. GCHD is awaiting a follow up conversation with the Flint Community Schools.
- Genesee County Health Department (GCHD) is starting to see an increase in requests for blood lead testing. GCHD Nursing Director, Toni LaRocco, is working with McLaren Health Plan to develop a lead clinic in November. University of Michigan-Flint has offered nursing students to assist at the clinic. Adults can use the Genesee County Health Department's Primary Care Clinic and the Health Department will bill insurance, or go on standing orders.
- Total filters distributed by MDHHS and GCCARD, 8,000. Genesee County Health Department has distributed 4,000 filters, which include approximately 2,700 to the public, 100 to Wellness Services, 100 to GCHD Primary Care Clinic, 100 to WIC, 100 to Reverence, and 375 to Hurley Maternal Infant Health Home Visiting Services.

Good morning, Eden and Rashmi, it is 50 and sunny in Atlanta, looking like a beautiful day!

I see we have a 9am call about the follow up testing; I'm forwarding the file that Bob Scott sent me yesterday, that summarizes what is in the lists he compiled for us. Can one of you forward on to the other meeting participants as appropriate? (I'm on my iPad so it is a little harder for me to maneuver the files.). Thanks, talk to you about 9am.

Nancy

## **Blood Testing Protocol Planning Template--- Oct 14 9 AM**

**Toni LaRocco, Nancy Peeler, Rashmi Travis**

### **I. Prioritization of Testing**

- a. Children <6 already tested positive by capillary since April 2014 (n=75)
  - i. Every week GCHD letters go out, educational material is also sent out (nutrition lead sources, etc.)
- b. Retesting of Flint children with EBLL of venous samples- all due for first or subsequent follow-ups
  - i. No additional letters to this group—[ Toni Note—no funding avail at this time to chase these folks- Medicaid already covered initial]
- c. School children those in the 3 schools identified as having elevated water lead (Freeman, Brunnell, Eisenhower)
- d. Every school facility- prioritization in this order:
  - i. 0-5 years age
    - 1. Daycare
    - 2. Great Start Readiness Pre-school (funded by MDE)
    - 3. Early Headstart
    - 4. Headstart
  - ii. 5-12 years of age
    - 1. Elementary
  - iii. >12 years of age
    - 1. Middle
    - 2. High

### **II. Implementation of Testing**

#### **a. Partners**

- i. McLaren Health Plan
  - 1. McLaren Health Plan is involved with Toni last few weeks. **Nov 5th** is a screening (capillary) event for McLaren clients as well as interested community members. This is a walk-in event-
    - a. Online lead registry (HHLPS) could be accessed to check child's status
    - b. McLaren has access to MCIR but not HHLPS
  - 2. McLaren will contact their clients, and test their clients
  - 3. GCHD will market to whole community, and GCHD WIC staff will draw other community members-cap or venous as indicated
- ii. UM-Flint Nursing students- Toni has been in touch with Nursing school and Licensed (BSN)nursing students may be able to assist Nov 5 and other times possible
- iii. Hurley Pediatrics (Mona)-(Mona on line)- (about n=900)
  - 1. Mona has all Hurley clinic kids that need a redraw back to April 2014

2. AND a list of all lead labs drawn from the Hurley Lab back to April 2014
- iv. Children's Healthcare Access Program-(MHEF and United Way)- target Medicaid groups by 4 clinics (Hamilton, Hurley, Dr. Akpinar and Mott)- they can access the majority of the Medicaid children in Flint and have data-sharing agreements already in place. Has social workers staff and 211 and case management, and filter follow-up
  1. Mott Children's Clinic (Reynolds)
  2. Housed at GFHC!
  3. Meeting tomorrow AM (Mona and Toni will be there)
  4. Hamilton FQHC
- v. Molina- Serve largest number of Peds/Medicaid-
- vi. GCMS Pete Levine---network information with all providers to get testing protocol information to them
- vii. Greater Flint Health Coalition-networking information to providers

**b. Sites**

- i. Emphasize patient centered medical home whenever possible
- ii. McLaren (Nov 5, 2015) at Burton Branch GCHD- all day
- iii. Farmer's Market (GCHD and Hurley Peds) held on (T, TH, Saturdays)
  1. Hurley staff can draw blood at this site
- iv. Molina- TBD (see below)
- v. Other health plans- TBD (see below)

**III. Handling of Results/messaging**

- a. CLPP and GCHD currently have protocol lab test result sharing (HHLPS)
- i. Bob Scott can assist in navigation
- b. Secondary prevention messaging for all community
  - i. nutrition, good vitamins
  - ii. wrap-around services
  - iii. positive parenting

**IV. Actions and Assignments**

- a. Toni and CHAP will contact Molina to set up similar program as McLaren
- b. Toni will contact all health plans- if issues, contact Wells
- c. MDHHS will provide support as requested for any events
- d. Hilda at GCHD needs to blast provider information about lead to all providers (blast fax and list serves)
- e. FAQ water lead sheet to be sent out today
- f. [Consider- Get HEDIS rates at provider level for lead (doesn't address follow-up, though)]
- g. Next Call: TBD early next week (of 10/19)
- h. Mona and Toni- if there is a need for increased capillary testing machines---advise MDHHS

From: Mona Hanna-Attisha  
Sent: Thursday, August 27, 2015 1:31 PM  
To: 'Johnson, M.D., Gary'; Schacher, Andrew (aschacher@gchd.us); 'Valacak, Mark'  
Cc: Hallwood, Dawn; Henry, James  
Subject: RE: Emailing: Lead Prescription

It was a pleasure meeting with Andrew today regarding the lead prescription program. As a follow-up:

- 1) We will work with Andrew and our lab and social worker to create an automatic electronic referral system for all kids with elevated lead levels. The referral will go to Andrew so that he can enroll them in his program.
- 2) Please use Hurley and MSU as a resource for lead programming, lead research, lead grant-writing, lead education, lead advocacy, lead whatever. Through Hurley, we have the providers, the patient population and the interest to work on pediatric public health issues. We clearly recognize the devastating and life-long impact of this entirely PREVENTABLE condition. Through MSU, we have the additional research capacity and the collaboration with the MSU Public Health Program (potential PH students and/or research hires interested in lead). We are eager to collaborate on this shared goal. Personally, I have a background in environmental health and this topic ideally merges the disciplines of pediatrics and public health.
- 3) Lastly, this may not be under the health department's jurisdiction; however, I don't understand why it wouldn't be - I am concerned about the potential for an increase in childhood lead poisoning secondary to the Flint drinking water situation. Flint had Safe Drinking Water Act violations for trihalomethanes after switching water sources. They dramatically increased their chlorine after switching sources. That changes the oxidation reduction potential and allows the metal of the pipe to go into solution. This is strikingly similar to what happened in Washington DC that resulted in significant childhood lead poisonings. It took about 2 years of lead leaching and exposure to result in elevated blood lead levels measured in 2003 as reported by CDC ([http://www.cdc.gov/nceh/lead/blood\\_levels.htm](http://www.cdc.gov/nceh/lead/blood_levels.htm)). I have an EPA colleague who worked on the DC issue and is aware/interested in the Flint issue.

Article about Flint's lead levels in water:

[http://www.deadlinedetroit.com/articles/12697/scary\\_lead\\_water\\_and\\_one\\_flint\\_family\\_s\\_toxic\\_nightmare#.Vd8yWVKVP9d](http://www.deadlinedetroit.com/articles/12697/scary_lead_water_and_one_flint_family_s_toxic_nightmare#.Vd8yWVKVP9d)

I know this has been a controversial issue, but it would be great if we can collaborate to prevent some of the same issues that happened in DC. Our children already significant pre-existing challenges (toxic stress/adverse childhood events), avoidable lead exposure should not be an additional burden. I would be more than happy to meet to discuss/brainstorm additional solutions.

Thanks again and looking forward to additional collaborations! Mona

<<Lead Prescription.pdf>> Mona--

Please read over the attached letter with the prescription. We sent you a similar letter on May 5th, hoping the pediatric residents would participate in the community outreach portion of this grant funded Childhood Lead Poisoning program.

Please re-consider having the pediatric residents participate in this community prescription program for children whose venous lead levels are between 5-14 as stated in the letter.

Please contact Dawn Hallwood via e-mail or phone letter as stated in the letter.

We would greatly appreciate your participation and the resident's participation.

Thank you very much.

Good afternoon, Dr. Carravallah,

We will keep looking, but our chief toxicologist affirmed my concern about filters for copper being able to reduce low enough for Wilson's and unfortunately they do not appear to be able to reduce lead.

NSF info at this page indicates that filters certified for copper reduction can take a 3 ppm or 3000 ppb level down to 1300 ppb. Not good enough for people with Wilson Disease who need copper <100. None of the filters certified to remove copper that I can see are also certified to remove lead.

Lisa is at a meeting in WI. She can confirm if she's able to see her e-mail.

Linda and Lisa---Just following up. Do the filters that I send you in lat evenings email for Dr. C reduce copper to below 100 PPB, and if so, are they NSF certified to m=remove lead also? I promised Dr. C I would follow up with her about this---even though I am concerned about need to directly link with the providers.

Will these filters (listed below) also remove lead? If so, can just recommend those filters to the patients (I am working with Pete to estimate how many there may be) and that may be our solution. They would need to meet the recommendations of the Wilson's Disease Society that Eden sent.

Pete said he can send out email on Monday.

Do you have recommendations as to how to proceed Mark?

I asked Jim Henry of my environmental health staff to research the copper filter reduction issue and talk to the people at NSF. His findings are below. I had a friend who used to work at NSF but is long retired. I remembered from a conversation that often manufactures get products certified for particular chemicals and there is a cost increase with each particular additional certification. So they limit the testing based upon what makes economic sense for them. In this example, it does not mean that the filters we are distributing do not reduce copper but more likely that they did not pay for that certification test to be run. If that test was not run they cannot claim to be "certified by NSF". Oddly Brita does advertise that their filter reduces copper but it is not listed on the sheet in the box as certified by NSF for that.

NSF did supply the filters list certified for copper reduction, which is included below for your information.

**Subject:** RE: CDC response about BLLs for adults

Great article. In box 1, lead in water is a risk factor and "blood lead testing should be performed if a single risk factor is identified at the earliest contact." So I would take this at first contact with OB, blood lead should be done and education on nutrition and vitamins, etc.

Our OB's don't know this. This need to be shared.

I don't think anyone knows to test pregnant women.  
Should we develop a separate communication to OB's?

As a secondary research project, we will be tested maternal lead at delivery and cord blood lead. But the above sounds like it should be a recommended screening???

---

Should recommend lead screening at prenatal visits? How will we know a pregnant woman's lead level?  
With pregnancy causing an iron deficiency state, they are more likely to absorb lead.

Linda

Here is the response from CDC regarding adult BLLs:

The CDC value for blood lead in pregnancy is below 5, with medical removal protection for pregnant women with levels  $\geq 10$  with their doctor's recommendation. (citation: <http://www.cdc.gov/nceh/lead/publications/leadandpregnancy>)  
For other adults the level depends on whether the individual is exposed at work which uses the OSHA standards.

**Subject:** Lead in Flint water supply

Dear Apparao,

A few days ago, I heard on NPR that the water supply in Flint is contaminated with lead. I heard a pediatrician from the Hurley Medical Center talking about the grave dangers to the public.

This story is of interest to me for two reasons: I am an environmental engineer with specialization in water treatment and my wife was diagnosed with very high levels of lead in her blood and urine two years ago after we returned from India.

Two years ago, my wife and I returned from India and, during a blood and urine test for some other health problem, she was diagnosed as having lead

concentration in her blood exceeding 100 times the maximum admissible by FDA (?) and in her urine exceeding 500 times the admissible value. I was worried about that and asked my family physician what could be done about it. He told me that over about 8 to 12 months the lead concentration will dissipate. I was worried about the effect of lead on brain and did not want to wait that long. I wrote an email to a naturopath friend in Ahmedabad, India. He asked me to boil half an ounce of cilantro every day in the morning in one cup of water for about 15-20 minutes, strain the water and drink the strained water. Continue this for 30 days. My wife did it for 4 weeks. The lead concentration in blood became normal.

I am writing this to you for whatever it is worth. I do not have your phone number so could not call you. If you need more information, please call me.

Manu Bhatt

**From Linda Dykema:**

I just spoke with the dog's owner and have his contact information.

They live in 48503 and they are on Flint water.

They have a 2-year old male dog who lost a lot of weight in a short period of time and they sought vet care. The dog's blood tested at a level of 409...not sure of the units, but the owner read from a vet report that said anything over 350 was considered lead toxicosis. They also have a 4-year old female dog who previously had 2 successful litters, but who delivered a single still born pup this morning (they would like the pup tested/autopsied but cannot afford the cost).

The adult female in the house is pregnant (1<sup>st</sup> trimester) and there are children <6 years living there as well. Father says he called GCHD a week and a half ago and was told to 1) see their family Dr., and 2) GCHD would call them back. To date no call back. All family members had venous draw today for lead testing. Dr. has told them to not use the water for bathing.

They received a filter from city of Flint. They sent a filtered water sample to a lab somewhere (man wasn't sure where) and the results indicate the filter doesn't work (man did not recall the lead level found).

**Subject:** Call-Lead Toxicity in a Dog

MDHHS has been notified this afternoon of a family from the Flint area whose dog was diagnosed with lead toxicity. I received a voice message from Dr. Michele Schalow with MDARD about this case, and Eden Wells was contacted by Linda Dykema, who was also informed of this case. At this time, I don't have any information about the dog or why it was tested, but information is that the testing was performed at MSU's Diagnostic Center for Population and Animal Health. Eden is getting ready to board a plane, so asked me to notify everyone. The family of the dog includes children and a pregnant woman. Her thought is that the family needs to be tested asap. Kim

Kim and Mary Grace- note below---were there any calls by you or Ag to family about the dogs chewing on wood? The family may have misinterpreted-- I ran into this myself when talking about other sources of lead in households to the general public and media- the community is

highly sensitized to issues of water, even if there may have been another source---makes it hard to investigate the dog issue, I know. Linda seems to have the best relationship with the family at this point, so she has been our primary spokesperson with them.

Karen Lishinski and I just spoke with the mother and conveyed the family's test results. It's uncertain at this time if we'll be doing any sampling at their home. Apparently [PHI] had a conversation yesterday with someone that made him (and her) very angry. Not sure who, but I've checked here and it was not anyone in DEH. The implication was that the family, wife, kids and dogs were all chewing on the woodwork. Family is feeling that the state is just looking to lay blame for the lead poisoning anywhere but the water. I've asked [PHI] to 1) talk with their Dr. about their test results, 2) talk to her husband about testing the house and water, and 3) talk directly to me if they have concerns or question.

Interesting.

Do these people understand that the half-life of lead in blood is only 1-2 months? What is the purpose of having these kids testing -- normal levels may be falsely reassuring and it's highly unlikely that we will pick up many EBLLS in this school age population.

There are also issues of consents, release of info to PMDs, follow-up, etc.

But people want something done, and they want something done fast. People are understandably mad. I'm just not sure if this is the best option, but there may be no choice.

**Gov. Rick Snyder announces Flint Water Task Force to review state, federal and municipal actions, offer recommendations**  
*Experts in public health, water management, environmental protection to focus on steps to protect residents*

||  
LANSING, Mich. – Gov. Rick Snyder today announced the creation of an independent advisory task force charged with reviewing actions regarding water use and testing in Flint and offer recommendations for future guidelines to protect the health and safety of all state residents.

Task force members include experts in public health and medicine, water management, and environmental protection from both sides of the aisle, and will be co-chaired by Ken Sikkema of Public Sector Consultants and Chris Kolb, of the Michigan Environmental Council. Also serving will be Dr. Matthew Davis of the University of Michigan Health System, Eric Rothstein, of the Galardi Rothstein Group and Dr. Lawrence Reynolds of Mott Children's Health Center in Flint.

"Transitioning back to the Detroit Water and Sewerage Department-Great Lakes Water Authority is a good first step to protecting public health in Flint, but it's not the last step," Snyder said. "Bringing in outside experts to evaluate our actions and help monitor and advise on potential changes to law, procedures and practices will be key to continuing work on the comprehensive action plan and ensuring safe drinking water for all the residents in Flint and all of Michigan."

Snyder said the administration will fully cooperate with task force members, saying he wants an unbiased report focusing on steps taken in the past and recommendations that could improve practices to ensure all residents have access to safe, clean water.

**Ken Sikkema** is a senior policy fellow at Public Sector Consultants, where he specializes in public finance, environment, and energy policy. Prior to joining the firm, Sikkema served in both the Michigan House and Senate, culminating with four years as Senate majority leader. He has also served as both an adjunct and visiting professor at Grand Valley State University.

**Chris Kolb** is president of the Michigan Environmental Council, a statewide coalition of 70 environmental, public health and faith-based nonprofit groups. Before joining the MEC, Kolb represented Ann Arbor in the state House for six years and served six years on the Ann Arbor City Council. He has been president of the MEC for six years.

**Matthew Davis**, M.D., M.A.P.P., is professor of pediatrics and internal medicine at the University of Michigan Health System and professor of public policy at the Gerald R. Ford School at the University of Michigan, having joined the faculty in 2000. Davis also is a professor of health management and policy at the School of Public Health. He previously served as the chief medical executive of the Michigan Department of Community Health/Department of Health and Human Services.

**Eric Rothstein** is a national water issues consultant and principal at the Galardi Rothstein Group. He served as an independent advisor on the creation of the Great Lakes Water Authority. Rothstein also has served as Jefferson County, Alabama's rate consultant and municipal adviser for litigation related to the county's bankruptcy and issuance of \$1.7 billion in sewer warrants and led strategic financial planning for the City of Atlanta's Department of Watershed Management. He has more than 30 years of experience in water, wastewater and stormwater utility finance and rate-making assessments.

**Lawrence Reynolds**, M.D., is a pediatrician in Flint who serves as president of the Mott Children's Health Center. He received his medical degree from Howard University College of Medicine and has been in practice for 36 years. He has served as president of the Genesee County Medical Society and the Michigan Chapter of the American Academy of Pediatrics. He has been honored for his humanitarian and advocacy efforts on behalf of children from the Community Foundation of Greater Flint.

Snyder has said reconnecting with the authority is a critical step to resolving water quality issues and addressing related health concerns. It will not immediately resolve the city's problem with lead service lines or aging infrastructure. It will take time for pipes in Flint to become coated with the phosphate corrosion control.

To best protect public health, state and local authorities will continue to carry out steps outlined on Oct. 2 in a comprehensive action plan, including continued testing, the use of faucet filters and providing residents with accurate information about steps to eliminate lead exposure. The Michigan Departments of Environmental Quality and Health and Human Services are continuing to provide free water filters, free lead testing through the state laboratory for Flint water customers, and hiring additional staff to conduct health exposure monitoring for lead in drinking water.

## Blood Testing/Case Management Protocol Planning Template

Oct 21, 2015 v7

GCHD, Hurley Pediatrics, and MDHHS

Toni LaRocco, Nancy Peeler, Rashmi Travis, Eden Wells , Mona Hanna-Attisha

### I. Prioritization of Testing

- A. Children <6 already tested positive by capillary since April 2014 (n=75)
  - 1. Every week GCHD letters go out, educational material is also sent out (nutrition lead sources, etc.)
  - 2. Sending letters at 5ug/dL (new; previously doing at 10 ug/dL)- Letter includes in bold to follow up with PCP
  - 3. 10 ug/dL: making phone call (or sending letter if unable to reach) offering an office visit where clients are given a lead kit which includes: vacuum with hepa filter, mop, simple green and soon will include NSF water filter, gloves and Swiffer. Education regarding use of above, nutrition and medical follow up guidance to return to PCP ; vacuum of HEPA Filter— if don't have specifications of HEPA filter—will not pick up lead particles—Toni will get clarification on who recommended this and Nancy will ask Bob Scott to check into this as well. Confirmed (10/21) that GCHD will not be giving HEPA filters until check with EH.
  - 4. 20 ug/dL: two visits with nurse and sanitarian with a referral to MDHHS Lead Safe Homes
- B. Retesting of Flint children with EBL of venous samples- all due for first or subsequent follow-ups
- C. All children under 6 yrs of age
- D. School children those in the 3 schools identified as having elevated water lead (Freeman, Brunnell, Eisenhower)
- E. Every school facility- prioritization in this order:
  - 1. 0-5 years age
    - a. Daycare
    - b. Great Start Readiness Pre-school (funded by MDE)
    - c. Early Headstart
    - d. Headstart
  - 2. 5-12 years of age
    - a. Elementary
  - 3. >12 years of age
    - a. Middle
    - b. High

### II. Implementation of Testing

- A. Payment for adults and child testing covered by:

1. Medicaid
2. Insurance
3. Local Health Department, if no Medicaid or insurance

#### **B. Partners**

1. McLaren Health Plan
  - a. **Nov 5th** is a screening (capillary) event for McLaren clients as well as interested community members. This is a walk-in event-
  - b. Online lead registry (HHLPS) could be accessed to check child's status
    - a. McLaren has access to MCIR but not HHLPS
  - c. McLaren will contact their clients, and test their clients
  - d. GCHD will market to whole community, and GCHD WIC staff will draw other community members-cap or venous as indicated
  - e. GCHD will look up kids prior to drawing.....if ever drawn and elevated GCHD will do a venous draw instead.
2. UM-Flint Nursing students- Toni has been in touch with Nursing school and Licensed (BSN)nursing students may be able to assist Nov 5 and other times possible
3. Hurley Pediatrics (Mona)-( n=900)
  - a. Dr. Hanna- Attisha has all Hurley clinic kids that need a redraw back to April 2014
  - b. Also have list of all lead labs drawn from Hurley Lab back to April 2014
    - a. Dr. Hanna Attisha looked at all the Hurley lab-processed lead levels, specifically all EBLLs geocoded to the city of Flint after April 2014
    - b. As expected, they come from the following providers in decreasing order of frequency. This matches with the CHAP data in regards to providers who see the most Medicaid patients in the county:
      - i. Hurley Children's Clinic
      - ii. Hamilton Health Center (FQHC) - multiple clinics
      - iii. Mott Children's Health Center
      - iv. Solo Private Practices - M Akpinar, N Ali
  - c. Children's Healthcare Access Program-(CHAP) - target Medicaid groups by 4 clinics (Hamilton, Hurley, Dr. Akpinar, Mott Children's Clinic (Dr. Reynolds)
    - a. Can access majority of Medicaid children in Flint and have data-sharing agreements already in place.
    - b. Has social workers staff and 211 and case management, filter follow-up
    - c. Housed at GFHC
    - d. CHAP- GCHD Toni LaRocco spoke with Susan from CHAP 10/14

- i. they are paid from a grant through the Health Endowment Fund
    - ii. Contracted (not signed yet but will be) to run Medicaid Match through GCHD.
    - iii. Doing things like arranging transportation to get lead levels drawn good role for them as it is reimbursable with Medicaid Outreach.
  - d. Hamilton FQHC
- 4. Molina- Serve largest number of Peds/Medicaid-
- 5. GCMS Pete Levine---network information with all providers to get testing protocol information to them
- 6. Greater Flint Health Coalition-networking information to providers

II A & B are more for planning purposes— not to be included

### III. Sites for Testing

- A. Patient Centered Medical Home- Use primary providers whenever possible! Very important. Getting tests done outside of the medical home creates lack of continuity and lack of follow-up. Encourage as much as possible to “go see your doctor”.
  - a. Which then means that we need to educate the doctors with direct messaging about who to test, when to test, what is follow-up, available resources (211), premade patient education flyers, etc. Focus should be on lead in water education info.
- B. GCHD
  - 1. GCHD (Toni LaRocco) Meeting with PIO and UMFlint Nursing in order to get assistance with Lead testing clinics.
  - 2. GCHD (Toni LaRocco) will be contacting other Medicaid Health Plans to try and have clinic with them at the Farmers Market
- C. McLaren- at Burton Branch GCHD- all day- confirmed Nov 5, 2015
- D. McLaren-(**Nov 5, 2015**) at Burton Branch GCHD- all day
- E. Farmer’s Market (GCHD and Hurley Peds) held on (T, TH, Saturdays)
  - 1. Hurley staff can draw blood at this site
- F. Molina-TBD
- G. Other health plans- Being contacted
- H. Schools- request Friday October 16 from Flint Community Schools Superintendent Bilal Tawwab for testing to occur at schools.

- Try to contact him Superintendent – Mona will do this to let him know what our plan is.
- What is the purpose of this? It goes against the face of creating the primary care home, also signing a release is a challenge; it is natural way of place for kids to go to

**Comment [EW1]:** This could impact role of primary care provider—thoughts? I need to respond to him.

- Have lowest school nurses to students—very minimal capacity to do this.
- Resolution with the Dept of Education
- Go to Primary Care doctor first
- Education with Primary Care doctors Testing
- 1. Daycare, Early Head Start and Head Start are priority. Two letters will be formulated to provide information to the following groups Letter for Flint area parents with children in daycare, EHS/HS, GSRP, and schools
- 2. Letter for primary care providers serving children from the Flint area
- 
- Work with ISD and Flint Schools to give them education piece to work with them in the classroom—1.) elementary and secondary school education children to limit exposure – Faculty of school education—city of Flint schools and through ISD (U of M Flint schools); GISD controls Early Start and Head Start and GCARD—between these 2 resources may be able to get information out soon.
- Work with Office of Great Start for licensed daycares—Toni can get to those groups through immunizations and through Nancy can work with Office of Great Start
- Limit risk, great nutrition, doctor
- Pushing for a WIC person in each clinic
- MSU Education pushing for nutrition education—lead-exposed diet
- go to one of 4 clinics can get children in
- Pharmacy looking for formula for Iron, Calcium, and Vitamin C—Vitamin D supporting absorption of calcium
- Who will get the information: Genessee Medical Society, Greater Flint Health Coalition, and Pediatrics groups that work through Hurley.
- What information will go to providers:
- Cover letter
- Make sure it is of the literacy level 4th grade level
- Nutrition
- Basics of how to get a filter
- 211 and connection other wraparound services

#### -Basic Prevention Strategies

##### -Testing—4 sites

-Nancy can check about putting Share Point site—to establish a central site—by noon today and get folder where we can all access the materials prior to their release.

-It is likely that this information could go to the Lead nurse, Karen Lishinski—send Share point address and email by noon.

-The protocol team will Review materials and what goes with letter

-Nancy and her team will draft a cover letter for review

-Cover Letter could go out with Dr Wells, Dr. Johnson, and Dr. Mona Hanna-Attish signatures?

-Dr. Hanna-Attish is working with pharmacies on providing a vitamin rich in iron, calcium, vitamin C, and vitamin D

-MSU Extension in Genesee County is also pushing out educational materials on nutrition education

-for Early On – for every family of 5 and above— -- not going to see it right away—established criteria is 10 Ug/dcl—most of the time with them aren't seen – can you make referrals to home visiting programs—primary care providers track and see; centralized home visiting hub—take a referral and send to other—GCHD to have a conversation with Dawn (in charge of Home Visiting Hub); If Hub can serve as single point of referral

-At home services—trauma informed systems of care collaborative—toxic stress exposures—some resources in CMH, parenting resources—conversation with Dawn and GCHD—a good portion can get information through CHAP on lead issues

-Most of the Hurley kids have been followed up to reach levels below 5 or recommend follow-up testing.

-Try to contact him Superintendent –Dr. Hanna-Attish will do this to let him know what our plan is.

If the Superintendent's call came through to Eden, she can connect with him as well to explain rationale and importance getting information out to providers.

III. Is more for Planning purposes—for protocol refer back to Primary Care Providers

#### **IV. Registration of lead testing clients**

A. HEALTH BLOOD LEAD ANALYSIS REPORTING (By authority conferred on the department of community health by 1978 PA 368, MCL 333.5111(1) and (2)(f), 333.5474(1)(c), and 333.20531; 1978 PA 312, MCL 325.72(a)(i), MCL 325.78; and Executive Reorganization Order No. 1996-1, MCL 330.3101):

1. All clients drawn will sign a release allowing result to be shared with primary provider
2. Upon initiating a request for blood lead analysis, the physician/provider or user ordering the blood lead analysis shall collect the following information:
  - (a) All of the following information with respect to the individual tested:
    - (i) Name.
    - (ii) Sex
    - (iii) The individual's ethnicity including either of the following:
      - (a) Hispanic or Latino/Latina.
      - (b) Not Hispanic of Latino/Latina.
    - (iv) The individual's race, noting the following:
      - (a) American Indian or Alaska Native.
      - (b) Asian.
      - (c) Black or African American.
      - (d) Native Hawaiian or Other Pacific Islander.
      - (e) White or Caucasian.
    - (v) Birthdate.
    - (vi) Address, including county, and, to the extent available, whether the residence or property is owned or rented.
    - (vii) Telephone number.
    - (viii) Social security number and Medicaid number, if applicable.
    - (ix) If the individual is a minor, the name of a parent or guardian.
    - (x) If the individual is an adult, the name of his or her employer.
      - (xi) A secondary contact for the individual tested or, if the individual is a minor, a secondary contact for the individual's parent or guardian, including, to the extent available, name and phone number of the secondary contact.
    - (b) The date of the sample collection.
    - (c) The type of sample (capillary or venous).
    - (d) The physician's/provider's or user's name, name of practice (if applicable), telephone number, fax number, email address, and mailing address.

~~IV All above is included on the form—not to be included on protocol~~

#### **V. Handling of Results/messaging**

- A. CLPP and GCHD currently have protocol lab test result sharing (HHLPS)
1. Bob Scott can assist in navigation
  2. MDHHS Bureau of Labs can provide surge capacity for lab testing if needed
- B. Secondary prevention messaging for all community
1. nutrition, good vitamins

2. wrap-around services
3. Breastfeeding, breastfeeding, breastfeeding – breastfeeding is protective for lead in water! Increase number of LC's, support breastfeeding peer programs, etc. Flint has low breastfeeding rate.
4. positive parenting/nurse family partnership, infant support services
5. WIC enrollment
6. SNAP double bucks enrollment

V Include on protocol—CLPPP receives lab; GCHD gets results from CLPPP; GCHD sends result to Primary Care Provider if testing done at GCHD.

#### Comments on letters:

-Parent—HV referral program; bolster 211 program- make it a one stop resource and access resource; Toni talked to Dawn about the LLG; Mona talked to Dawn about HV program there are so many program, access info through 211 or Hub—confirmed that Hub no longer exists, trying to work with 211; Mona will follow- up to getting those things up to date; in parent letter that every kid recommended to be tested—should we put an upper age limit on it—include under 6 yrs of age; should I get a lead test—speak to your doctor

-Include info on Lead Safe Home—it is too much info—before referral goes to EBL Investigation; other issue of it coming from the doctor—required reporting information—keep flyer about program; do not include flyer as part of case management.

#### Documents for Parent:

All documents send to Share point site. Once finalized—send through approval with Communications.

-FAQ DEQ one—(approved—need logo)

-Is your Child Safe from Lead

-Fight Lead Poisoning with a Healthy Diet (EPA)—keeps pages on nutrition info and condense to 2 pages; add 211, Health Dept number, WIC number, SNAP number, Double Bucks number

#### Documents for Provider:

-Handout Blood Level Quick Reference Primary Care Providers

-Handout Pregnant and Nursing Mothers Lead

-Is your Child Safe from Lead

-Fight Lead Poisoning with Healthy Diet (EPA)

-FAQ DEQ one

Distribution to all OB doctors; through Medical Society Genessee County

Signatures—Dr. Johnson, Dr. Mona Hanna-Attish, Dr. Eden Wells

Get comments on letters by 11AM (Oct 21) to Nancy. Nancy will post final one.

Karen Lishinski will work on condensing protocol based on recommended sections to include by 12PM.

## EBL Investigations/Case Management Protocol

### A. Payment for EBL Investigations:

1. Budgeted currently for 250 EBL investigations (to include water testing) for every child with elevated blood lead > 5mcg/dl.
2. The U.S. Department of Health and Human Services recommends that BLLs among all adults be reduced to <10 µg/dl- so follow-up for adults will be at levels >10 mcg/dl (<http://www.cdc.gov/niosh/topics/ables/description.html>)
3. Medicaid will pay for 2 nursing visits following up for their clients

Comment [EW2]: ?????Sound OK?

### B. EBL Investigation Implementation

EBL Investigations not to include in testing protocol

I. **Actions and Assignments for Week of October 19, 2015 (Highlighted red is complete)**

- A. GCHD/Toni LaRocco and CHAP will contact Molina and other health plans to set up similar program as McLaren; CHAP is not going to be able help—can only help transportation for testing, but not screening, but can help for transportation to providers; GCHD PIO has contacted mass transit
- B. GCHD/Toni la Rocco will contact all health plans- if issues, contact Wells
- C. MDHHS will provide support as requested for any events
- D. Hilda at GCHD needs to blast provider information about lead to all providers (blast fax and list serves)
- [REDACTED]
- F. Dr. Hanna- Attisha and GCHD-If need for increased capillary testing machines---advise MDHHS
- G. Activities/follow up by Nancy/Bob
1. Work with Communications to support linkage to other early childhood/school state partners at MDE that we already work with that were listed in the plan - Office of Great Start is the link to child care providers (related to subsidy payments and to their subcontract to ECIC to run regional child care resource/TA centers); they are also the state liaison to Head Start/Early Head Start and the Great Start Readiness at-risk preschools. And of course their School Health office.
  2. Access to HPLPSS data system - currently only GCHD has access - Bob thinks that 2 staff there have been trained to use the system, but we need to confirm when we are back at the office. As I referenced above, we are looking at lead privacy laws to see who else (besides GCHD) might be able to have access to the CLPPP data about follow-up testing.
  - [REDACTED]
  4. Regarding CLPPP sending our list of children needing follow-up to Hurley (when we think there is a Hurley provider), we are also confirming that we can do that based on privacy laws.
  5. We will follow up to make sure that the new CLPPP toolkit materials for providers get out to all of you - our Provider Quick Reference document, and the video Eden referenced is coming soon
  6. Exploring legal issues around access to the data.
- H. Wells will get back with Flint City Superintendent regarding issues of school clinics depending upon October 19 meeting
- I. ALL- Develop messaging for all healthcare providers in Flint regarding testing, getting their clients in for testing, and using an approved form that requests required reporting information.
- J. MDHHS Wes Priem-Develop form for blood test registration/required information

K. ALL - Disseminate form

Questions from Nancy/Bob—October 14

- Medicaid will pay for 2 nursing visits. Toni, I wanted to double check, at what levels is GCHD currently sending out nurses to follow up on elevated blood lead levels (even if only 2 visits) ? And I wasn't sure if I understood on the call - is GCHD billing Medicaid for those visits for children enrolled in Medicaid? Are billing for those visits
- We agree that CHAP could be a good resource that could try to find kids and help get them connected for testing/follow-up testing. Are they paid by health plans/clinics to carry out activities, e.g. that is who their direction comes from (I know that was the model in Kent County)? I ask that related to our thinking about who the CLPPP data (e.g. access to the HHLPPS data system) could go to - we have to explore the privacy laws for the lead data.
- We concur about using Lead Care machines, but only if there is a better protocol to ensure that children with an elevated capillary test get back for venous testing.

-McLaren doing filter paper—if show up at GCHD doing Lead care machine—can get results that day—elevated capillary—nutrition information, send results with all of that regardless of elevated

-Release signed at Nov 5<sup>th</sup> event—mailing letter to family and letter to doctor.

-Other clinics—Toni has connected Molina, Meridian, and McLaren; Total HealthCare has small % of clients—looking at HEDIS results and looking to those kids of who haven't been tested; biggest offer is transportation—CHAP can help arrange for transportation—for Medicaid outreach.—include same phone number for school letter.

Next Call – Wed morning 10/21 9AM to finalize documents for distribution to providers and schools.

**This Document is a Non-Responsive Attachment.**

**To:** LaRocco, Toni; Mona Hanna-Attisha; Peeler, Nancy (DHHS); Travis, Rashmi (DHHS)  
**Subject:** RE: SCHOOL TESTING\_ ALERT

Hi folks,

All on the state-local call today were vociferous that testing should not be on the school sites. Mark V will be asking the Flint City Schools super and Rep Neeley to get on a call with him and I and Mona to discuss this stance.

E

**Subject:** RE: SCHOOL TESTING\_ ALERT

I think that we are being responsive and we need to work hard to educate all concerned. There are clinics that are an option as well as the medical home. This is a knee jerk reaction.

---

**Subject:** RE: SCHOOL TESTING\_ ALERT

Interesting.

Do these people understand that the half-life of lead in blood is only 1-2 months? What is the purpose of having these kids testing -- normal levels may be falsely reassuring and it's highly unlikely that we will pick up many EBLLS in this school age population.

There are also issues of consents, release of info to PMDs, follow-up, etc.

But people want something done, and they want something done fast. People are understandably mad. I'm just not sure if this is the best option, but there may be no choice.

**Subject:** SCHOOL TESTING\_ ALERT

**Importance:** High

Folks,

Got off the phone with our Director. He is pushing to have on-site lead testing at schools, particularly the 3, in addition to getting primary care providers involved. Pushing to have that done SOON. Imagine sending home permission slips on a Monday and attesting on a Thursday. Could get mass volunteers to help. His words!

I will need to get on the phone with a few politicians early this afternoon bout this as well. I will get back to you all.

Yes-- much better- in priority 3, daycare and head start and preschool all should be in first paragraph-- all same level. Question- they should be priority 2 - leaving "all other children..." As priority 3?

**Subject:** RE: Blood Testing-Version 4 Call

I don't know if the "Tips for Flint Residents" is finalized, and I'm not even sure if I was supposed to look at it, but I have a few edits. Sorry, I'm totally OCD. Under #2, people can also just call 211 to get a filter (this can be added to all handouts for filter access). I'm not sure if it was literacy tested - some big words like accumulate, precautions, etc. Fine print at bottom is same as #1, can just add email to #1. I would also reword sentence under title to "Lead plumbing is common throughout Flint and in all homes built before 1986. Always follow the below steps to ensure safe drinking water."

Attached are my revisions to the parent letter. I tried to simplify and consolidate -- it's in markup mode. I have a 8:15 meeting, but will try to take a stab at provider letter as well before 9am meeting

Hi all – draft letters for Providers and for Parents in Flint are posted in our Sharepoint folder called Flint Workgroup. We put them in both Word and .pdf formats, to assure you can open them. They are rough drafts, so please do add/suggest language where there are placeholders.

Appreciate if you can review and make comments/suggest edits. To find the letters:

Navigate to [www.midppp.org](http://www.midppp.org)  
On the dark blue navigation bar, click on Workgroups & Toolkits  
Click on the FLINT WORKGROUP folder

Nancy

**To:** Rockefeller, Cheryl (DHHS); Wells, Eden (DHHS); Toni Larocco [tlarocco@gchd.us](mailto:tlarocco@gchd.us); Mona Hanna-Attisha ([MHanna1@hurleymc.com](mailto:MHanna1@hurleymc.com))  
**Cc:** Travis, Rashmi (DHHS)  
**Subject:** RE: Blood Testing-Version 4 Call  
**Importance:** High

Hi everyone -- per our morning conversation, we have created a folder on our Sharepoint site where we can upload documents that we might want to attach to the letters we discussed this morning:

1. Letter for Flint area parents with children in daycare, EHS/HS, GSRP, schools
2. Letter for primary care providers serving children from the Flint area

Please send any materials you think could be good attachments to Emily Houk ([HoukE@michigan.gov](mailto:HoukE@michigan.gov)). Emily is standing by to upload the documents to the folder.

To access the folder, please go to [www.midppp.org](http://www.midppp.org)  
On the dark blue navigation bar, click on Workgroups & Toolkits  
Click on the FLINT WORKGROUP folder – which is where we will post these materials

We agreed to review materials by Wednesday morning, 10am, to try to finalize the letters at that point.

We are drafting the letters now, will put the draft letters in the same folder, and I will email you once they are posted for your review and comment.

Thanks -- let me know if you have questions or problems accessing the folder.

Nancy

Eden V. Wells, MD, MPH, FACPM

Chief Medical Executive

Michigan Department of Health and Human Services

201 Townsend St., 5<sup>th</sup> Floor CVB

Lansing, MI 48913

Dear Parent,

~~As you may have heard in recent news reports, lead has been found in the City of Flint's water system.~~

To help make sure the children of Flint are safe from ~~lead exposure, this serious health hazard,~~ the Michigan Department of Health and Human Services, with partners at the City of Flint, Genesee County Health Department, ~~Genesee Intermediate School District and Hurley Health Systems~~ Children's Hospital want to help ~~parents and caregivers~~ you understand to:

- ~~Where does lead come from?~~
- ~~What can I do to protect my family?~~
- ~~Understand more about lead poisoning and how to protect your family;~~
- ~~Should I get my child tested for lead? Learn how to get your child tested~~
- ~~Understand how to get their/your household water tested~~
- ~~Know how to get help if your/a child has been exposed to lead. Where can I find more information about lead?~~

**Comment [1]:**

May also need to add Flint Community Schools - not always part of GISD

~~Where does lead come from? Understanding Lead Poisoning~~

~~Where does lead come from? Lead is a serious health hazard, especially for small children who become lead poisoned when they eat, drink or breathe lead. Elevated levels of lead have been found in the drinking water in the City of Flint. Kids can also be exposed to lead from old lead paint, soil, pottery, cosmetics and toys, and some home remedies. Adult jobs and hobbies, like auto repair, stained glass, jewelry making, and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.~~

~~Protect Your Family What can I do to protect my family?~~

~~Protecting your family from Lead in the Water and Obtaining Water Filters.~~

- ~~Get your water testing for lead. It's free. Just call ....~~
- ~~Testing of the water in your home is recommended and is free. If you live in Flint, use a NSF/ANSI 53 water filter in your home. Water filters are easy to install and available for free. Call 211 for a free water filter at x.x.x.~~
- ~~If you do not have a water filter, use bottled water for drinking and mixing formula.~~
- ~~When cooking or washing dishes in tap water, run the water for at least five minutes before you use it.~~
- ~~Use cold water.~~

**Lead in the Home.** Lead is a serious health hazard, especially for small children who become lead poisoned when they eat, drink or breathe lead. The most common cause of lead poisoning is lead paint. However, lead is also found in drinking water, soil, pottery, cosmetics and toys, and some home remedies. Adult jobs and hobbies, like auto repair, stained glass, jewelry making, and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.

**Lead in the Water and Obtaining Water Filters.** Elevated levels of lead have been found in the water in the City of Flint. Testing of the water in your home is recommended and is free. If you live in Flint, use a NSF/ANSI 53 water filter in your home. Water filters are easy to install and available for free at x y z. If you do not have a water filter, use bottled water for drinking and mixing formula. When cooking or washing dishes in tap water, run the water for at least five minutes before you use it.

#### Protect Your Family

**Nutrition Matters.** Some foods will help keep lead from being stored in a child's body. Foods with calcium like milk, cheese, yogurt, and tofu are helpful, as are green leafy vegetables like spinach and cabbage. Iron rich foods also help reduce lead from being stored. Iron is in beans, lean meats like fish and chicken, whole grain cereals and peanut butter. Foods with Vitamin C will also help protect your child. These are foods like oranges, orange juice, grapefruits, tomatoes and green peppers. Avoid fatty foods like cookies, cakes, pizza, bacon, potato chips, french fries and hot dogs. Talk to your pediatrician about giving your child a multivitamin every day. Give your child a Multivitamin each day.

Protecting your family from other lead sources:

**Safe Cleaning is Important.** Keeping your home clean and safe from lead hazards will help to protect your family.

- Keep children away from lead paint and dust.
- Use wet paper towels to clean up lead dust. Be sure to clean around windows, play areas and floors.
- Wash hands and toys often, using soap and water.

**Nutrition Matters!** Some foods will help keep lead from being stored in a child's body, especially foods with a lot of calcium, iron and vitamin C. Calcium containing foods include milk, cheese, yogurt, and tofu are helpful, as are green leafy vegetables like spinach and cabbage. Iron is in beans, lean meats like fish and chicken, whole grain cereals and peanut butter. Foods with a lot of Vitamin C include oranges, orange juice, grapefruits, tomatoes and green peppers. Avoid fatty foods, like cookies, cakes, pizza, bacon, potato chips, french fries and hot dogs. If you are concerned about your child's diet, talk with your pediatrician who may also recommend a daily multivitamin.

**Comment [2]:**  
avoidance of fatty foods is no longer recommended for lead. Concern about limiting fatty foods for kids with developing brains (less than 2yr)

**Formatted:** Space After: 0 pt

**Formatted:** Font: Calibri

**Formatted:** Indent: Left: 1.03", Space After: 0 pt, No bullets or numbering

**Comment [3]:**  
avoidance of fatty foods is no longer recommended for lead. Concern about limiting fatty foods for kids with developing brains (less than 2yr)

WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the Genesee County WIC office at (810) 237-4537 to learn more. SNAP also offers a Double Bucks program to purchase even more healthy food for no additional costs.

~~When Testing is Necessary~~ **Should my child get a blood lead test?**

Children who live in the City of Flint or attend school, childcare or often spend time with a caregiver in the City of Flint should be tested for lead poisoning. ~~Pregnant and breastfeeding women living, working or attending school in Flint should also be tested. [?]~~

**Where should I go to get a blood lead test for my child?**

The best place to get your child's blood lead test is at your pediatrician's office. Your pediatrician will be able to follow up on the labs and provide you with the needed medical and preventative care. If you are unable to go to your doctor, you can also go to the Genesee County Health Department (phone number...).

~~What is a lead test? Testing for lead poisoning is a blood test and is most often done with a quick finger prick. Contact your doctor or the Genesee County Health Department to request a lead test.~~

**Understanding your child's lead test result.**

- Lead only stays in your blood for about one to two months, so the blood lead level that is done will only reflect recent exposure.
- A lead level below 5 mcg/dl means there is very little lead in your child's blood. You doctor will probably may suggest retesting your child within the next 12 months to make sure the level is not going up.
- A lead level of 5-14 mcg/dl means that child has had some exposure to lead. Work with your doctor and local health department for further guidance on how to make your home safe limit your lead exposure. Your doctor will probably may want to retest your child in 1-3 months to make sure the level is not going up.
- Children with very high levels of lead (over 40) may require treatment at the hospital.

~~Follow-up testing. If your child has been exposed to lead, it is very important that they have follow-up testing to make sure the lead level is going down. Children with very high levels of lead (over 40) may require treatment at the hospital.~~

**Transportation.** If you need help with transportation to have your child tested at your doctor or health department, please call 211.

**Where Can I get more information on lead? to Find Help**

Formatted: Space After: 0 pt

Formatted: Font: Calibri

Formatted: Font: Calibri

- Website for MDHSS lead stuff
- CDC
- County health dept, etc

~~Blood Testing.~~ Contact your doctor or the Genesee County Health Department to get a lead test.

~~Water Testing.~~ Water testing is free at the X, Y, Z. Contact ABC to find how to have your water tested.

~~WIC and SNAP.~~ WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the Genesee County WIC office at (810) 237-4537 to learn more.

~~Child Development.~~ If you have concerns about your child's growth, development or learning contact the ABC to learn about an Early Childhood Home Visiting Program in your area.

I am verifying that our communications person did have Mona's edits. I am pretty sure I sent them to her...but checking.

I think in some instances, we couldn't use everyone's edits as they contradicted each other, or were solely focused on water (didn't reference other source of lead), or framed in a way inconsistent with how we have been doing messaging in our other materials. Complicated.

So, as we get Jennifer Eisner's comments back and do another round of editing, we can certainly look at Mona's edits (again)? If you feel that we are in a position where we must use her edits regardless of other considerations, please tell us.

Dear Eden, Mark and Kay,

I am attaching a draft letter from the medical society that will likely go out today and also my commentary relating to the conversations I have had with the liver services at Henry Ford and UM Ann Arbor.

---

I think the letter is good. I would suggest adding a paragraph - see below.

I was able to talk to a Dr. Segovia with Henry Ford hepatology (recommended by Dr. Kim Brown, Director of their Liver Transplant service), and also the nurse of Dr. Askari at UM, the Director of the Wilson Disease clinic there.

Dr. Segovia did not have any specific suggestions - they just tell their patients to get their water tested and act accordingly. She was interested in what we find. Dr. Askari's nurse said they tell their patients to use either DISTILLED water (not bottled - for instance they said Dasani actually has rather high levels of copper) OR get a reverse osmosis system. I found some of these systems online and they ranged in price with some around \$150 or so. I don't know which ones are good.

Dr. Segovia said they may have 1-2 patients with Wilson Disease at the most. Dr. Askari's nurse thought there may be 10 or less in the clinic at UM (they ask them back for annual checks when stable). She said all of their patients get the above advice.

I would propose that we add a paragraph that says:

"The UM Wilson Disease clinic director, Dr. Askari, recommends that all Wilson Disease patients use either specifically distilled water (not all bottled water is

distilled), or a reverse osmosis system. We are hoping to get a reasonably accurate number of patients who may be affected so that we can get the information to them (through you, or through an outside referral clinic) and also see if it is possible to get funding for those who may have difficulty obtaining the necessary water or system, particularly during the next year when the water is still considered more corrosive than average. It is also important to note that copper pipes tend to be more common in newer homes, so the distribution of high concentrations of copper in water may be different than that for lead."

I am also going to send this information to Eden Wells at MDHHS at her request.

When I spoke to Dr. Marc Edwards on the phone, he did send a list of all the other metals for which he tested and none were over the action limit. As may have been mentioned earlier, he also said that there were no samples which had copper over the action limit, but that is not the appropriate limit for patients with copper storage disease. This problem is clearly much less widespread than the lead problem, but after being surprised once, I don't want for us to leave anything else out this time around.

Good afternoon!

At the request of Peter Levine, please find a draft letter attached for your review.

After you have taken a moment to review this letter, please respond with your comments regarding additions/edits, or with your approval.

Thank you in advance for your attention and response.

Respectfully,

*Sherry Smith*

**Subject:** FW: DRAFT DELIBERATIVE; NOT SUBJECT TO FOIA - drinking water lead level

Eden and Sue,

The attached provides the draft justification for screening values to be used to evaluate the results of drinking water sampling efforts at Flint schools.

HHS Division of Environmental Health toxicologist Jennifer Gray conducted the modeling and drafted the justification along with Toxicology and Response Section manager Kory Groetsch. They met with a select group of DEQ toxicologists, incorporated their comments and

suggestions, the obtained concurrence on the appropriateness of the inputs and the conclusions. DEQ Dept. Dir. Jim Sygo has also been provided with the draft justification.

A risk management decision is now needed and there are 2 options: a single screening value of 2 ppb that would apply to all schools including daycares and elementary schools OR a 2-tier approach in which 2 ppb would apply only where children 0-12 months are present, but a higher concentration of 11 ppb would be used to protect children up to 7 years.

**GCHD and MDHHS Partner to Issue Guidance to Flint Parents, Providers**

FLINT, Mich. – In a joint effort to continue education within the community around lead exposure, the Genesee County Health Department (GCHD) and Michigan Department of Health and Human Services (MDHHS) today issued letters to parents and the provider community in Flint to assist in providing guidance to support families.

In response to the elevated blood lead levels found in some Flint children, GCHD and MDHHS have worked together closely to develop guidance for families and providers.

**GCHD QUOTE**

Parents are being provided information regarding lead testing, how to reduce lead exposure for your family, where lead comes from, and community and state resources for more information. Children can be exposed to lead from drinking water in lead pipes, old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass and jewelry making, and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.

“As we continue to find ways to educate and guide the Flint community towards reducing lead exposures, we are appreciate of the collaboration with Genesee County Health Department,” said Dr. Eden Wells, Chief Medical Executive with MDHHS. “Parents and providers can take a number of steps to help reduce exposure, identify signs of lead poisoning, and begin follow up care as needed. Working together we can all help to protect the health of families in Flint.”

Primary care providers can assist in helping to ensure that children and families exposed to lead receive the care and resources they need to manage the potential health impacts of lead poisoning. MDHHS and GCHD worked with Dr. Mona Hanna-Attisha of the Hurley Medical Center to develop testing protocols and guidance regarding identification of lead poisoning, management of elevated blood lead levels, follow-up care, and community and state resources.

GCHD and MDHHS issued the following recommendations for parents:

- Families who live in the City of Flint and are on the Flint water system or who attend school, childcare, or spend time with a caregiver in the City of Flint, are encouraged to get their children tested for lead poisoning at their doctor’s office or GCHD.
- Families can get their water tested for lead for free. Call 810-787-6537 for details about how.
- Families are encouraged to use a water filter in their home, and free filters are still available. Call 2-1-1 for information about where to pick up a free filter.
- Use filtered tap water for drinking (including making coffee, drink mixes, juice, baby formula), and cooking (even if you boil the water, the lead will stay in the water and food). Always use cold water when cooking.
- You can use unfiltered tap water for washing your hands, and washing dishes. If using unfiltered water, run the water for at least five minutes before you use it.
- Safe cleaning can also reduce the risk of lead exposure in the home. You can use unfiltered tap water for the following wiping down countertops, mopping floors, and washing clothes.

- Keep children away from lead paint and dust; use wet paper towels to clean up lead dust around windows, play areas and floors; and wash hands and toys often, using soap and water
- Lastly, always wash fruits with filtered water. Some foods help keep lead from being stored in the child's body, such as Calcium rich foods, Iron rich foods, and foods with Vitamin C.

GCHD and MDHHS will continue to provide more information to the community regarding reducing lead exposure and protecting the health of Flint residents. For more information, visit [www.michigan.gov/lead](http://www.michigan.gov/lead).

**This Document is a Non-Responsive Attachment.**

October 22, 2015

Dear Parent,

To help make sure the children of Flint are safe from lead exposure, the Genesee County Health Department and the Michigan Department of Health and Human Services want to help you understand:

- Where does lead come from?
- What can I do to protect my family?
- Should I get my child tested for lead?
- Where can I find more information about lead?

### **Where does lead come from?**

Lead is a serious health hazard, especially for small children who become lead poisoned when they eat, drink or breathe lead. Elevated levels of lead have been found in the drinking water from lead pipes in the City of Flint. Kids can also be exposed to lead from old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass, jewelry making and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.

### **Should my child get a blood lead test?**

Children who live in the City of Flint, live in a home using City of Flint water, or who attend school, childcare or often spend time with a caregiver in the City of Flint should be tested for lead poisoning. *This should be done as soon as possible.*

### **Where should I go to get a blood lead test for my child?**

The best place to get your child's blood lead test is your doctor's office. Your pediatrician will follow up with you on lab tests and provide you with information on what to do next. You can also have a lead test at the Genesee County Health Department. If you need transportation, contact 2-1-1 for help.

### **Understanding your child's lead test result.**

**A lead level below 5** means there is little or no lead in your child's blood. Use the tips below to help keep your child safe. Your doctor may suggest retesting your child within the next 12 months to make sure the level does not go up.

**A lead level of 5-14** means that your child has had some exposure to lead. Work with your doctor and local health department for further guidance on how to limit your lead exposure. Your doctor may retest your child in 1-3 months to make sure the level does not go up.

Children with very high levels of lead (**over 40**) may require treatment at the hospital.

### **What Can I Do to Keep My Family Safe?**

The following steps should be taken right away to help protect you and your child.

#### **Protecting your family from lead in the water:**

- Get your water tested for lead. It's free. Call 810-787-6537 to learn more.
- Use a water filter in your home. Call 2-1-1 for information on free water filters.
- If you do not have a water filter, use bottled water for drinking and mixing formula.
- Use filtered tap water for drinking (including making coffee, drink mixes, juice, baby formula), and cooking (even if you boil the water, the lead will stay in the water and food). Always use cold water when cooking.
- You can use unfiltered tap water for washing your hands, and washing dishes. If using unfiltered water, run the water for at least five minutes before you use it.

#### **Safe cleaning:**

Safe Cleaning is important. Keeping your home clean and safe from lead hazards will help to protect your family.

- You can use unfiltered tap water for the following wiping down countertops, mopping floors, and washing clothes.
- Keep children away from lead paint and dust.
- Use wet paper towels to clean up lead dust. Be sure to clean around windows, play areas and floors.
- Wash hands and toys often, using soap and water.

#### **Good nutrition:**

Some foods will help keep lead from being stored in a child's body. These are foods with a lot of calcium, iron and vitamin C. These foods include:

**Calcium Rich Foods**

**Iron Rich Foods**

**Foods with Vitamin C**

- |           |                                    |                 |
|-----------|------------------------------------|-----------------|
| ➤ Milk    | ➤ Beans                            | ➤ Oranges       |
| ➤ Cheese  | ➤ Lean meats like fish and chicken | ➤ Orange juice  |
| ➤ Yogurt  | ➤ Whole grain cereals              | ➤ Grapefruits   |
| ➤ Tofu    | ➤ Peanut butter                    | ➤ Tomatoes      |
| ➤ Spinach |                                    | ➤ Green peppers |

Always wash your fruits with filtered water. If you are concerned about your child's diet, talk with your pediatrician who may also recommend a daily multivitamin.

WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the **Genesee County WIC office at (810) 237-4537** to learn more. SNAP also offers a Double Bucks program to purchase even more healthy food for no additional costs.

#### **Where can I get more information on lead?**

PROVIDER DRAFT LETTER V.2

October 22, 2015

LoRocco Edits, Travis Edits, Attisha Edits, Peeler Edits

Cross checked with parent letter

Dear Provider:

As you may be aware from recent news reports, elevated levels of lead have been found in the City of Flint's water system.

To help protect the children of Flint from the current lead in water exposure, the Genesee County Health Department and Michigan Department of Health and Human Services are contacting you to assist you in providing guidance to support your families.

Children can be exposed to lead from drinking water in lead pipes, old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass and jewelry making, and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.

As a primary care provider, you play a critical role in helping to ensure that children and families exposed to lead receive the care and reassurances they need to manage the potential health impacts of lead poisoning.

**Identification.** Children suffering from lead poisoning often fail to present outward symptoms. However, early clinical symptoms can include anemia, anorexia, abdominal pain and constipation. Lead is a neuro-toxin, and exposure can result in violent and aggressive behaviors, lead to learning disorders, may cause Attention Deficit Hyperactivity Disorder (ADHD) and has been known to reduce IQ by as many as 5-8 points with levels as low as 10 ug/dL. Lead is metabolized through the gastrointestinal system similar to iron and calcium, with uptake rates depending on the size and weight of the child. The blood half-life of lead is short (approximately 1 month) but the bone half-life can extend into decades.

Due to multiple risk factors facing many residents in the City of Flint (including aging housing conditions and water quality), we recommend that all children under age 6 living in the City of Flint or living in homes that use Flint water, attending school or childcare in Flint, or who spend time with a caregiver in the City of Flint, receive a blood lead test. Blood lead testing should be done through a child's primary care doctor to ensure adequate short-term and long-term follow-up. ***Families should be encouraged to have their children tested immediately either at their doctor's office or the Genesee County Health Department.***

October 22, 2015

LoRocco Edits, Travis Edits, Attisha Edits, Peeler Edits

Cross checked with parent letter

**Management of Blood Lead Levels.** The following guidance is provided for management of childhood blood lead levels:

- **BLL < 5 ug/dL**
  - A lead level of less than 5 mcg/dL is not typically cause for concern.
  - Provide education and anticipatory guidance to ensure that lead levels do not rise.
  - Consider retesting in 12 months based on risk factors or concerns.
- **BLL > 5 ug/dL**
  - **Children with capillary results of 5 ug/dL and higher must have a confirmatory venous blood draw.**
  - Families should receive anticipatory guidance, nutrition counseling, instruction on safe cleaning techniques and appropriate follow-up care from their primary care provider.
  - In-home services including case management and environmental investigations are available for all children with lead levels greater than 5 ug/dL. Refer patients to the Genesee County Health Department for this service.
  - Children with confirmed venous testing results greater than 5ug/dL within the past 18 months must be retested based on Medicaid policy and AAP guidelines. (See attached "Provider Quick Reference). If a child has not been retested within these timeframes, retesting is recommended as soon as possible.
- **BLL > 44 ug/dL.**
  - **Children with capillary results of 5 ug/dL and higher must have a confirmatory venous blood draw.**
  - Lead levels over 44 ug/dL may require hospitalization. Consult with an expert at the Children's Hospital of Michigan in Detroit for additional guidance.
  - Families should receive anticipatory guidance, nutrition counseling, instruction on safe cleaning techniques and appropriate follow-up care from their primary care provider.
  - In-home services including case management and environmental investigations are available for all children with lead levels greater than 5 ug/dL. Refer patients to the Genesee County Health Department for this service.
  - Children with confirmed venous testing results greater than 5ug/dL within the past 18 months must be retested based on Medicaid policy and AAP guidelines. (See attached "Provider Quick Reference). If a child has not been retested within these timeframes, retesting is recommended as soon as possible.

**Reminder: All children covered by Medicaid must be tested at age 1 and 2.**

October 22, 2015

LoRocco Edits, Travis Edits, Attisha Edits, Peeler Edits

Cross checked with parent letter

**Follow-up Care.** As providers, there are steps you can take to help support your families:

1. Continue to educate families regarding lead risks and preventative steps that they can take to minimize their risks.
2. Encourage your families to use filtered water for drinking, mixing formula and washing dishes. Families can contact 2-1-1 for information on free water filters.
3. Healthy nutrition is critical for lead-exposed children. Make sure your patients are consuming balanced diets high in iron, calcium and Vitamin C. If you have concerns about their nutrition, consider recommending a multivitamin with iron. WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the Genesee County WIC office at (810) 237-4537 to learn more. In addition, SNAP offers a Double Bucks program that can provide healthy foods for less.
4. Breastfeeding is highly protective and encouraged. However, if the mother's blood lead level rises above 40ug/dL or her level is greater than 20 ug/dL and the baby has a level above 5 ug/dL breastfeeding is not recommended.
5. Because lead is a neuro-toxin, children with lead poisoning need longitudinal follow-up and may require developmental and behavioral health intervention services. Continue monitoring your patients' development at every visit.
6. Consider additional wrap-around and support services that will benefit your patients such as early childhood home visiting programs, early head start and head start. Call 2-1-1 for more information.

**Local Resources.** Several local resources are available to you and your patients:

- Blood Testing. Patients are encouraged to contact their primary care provider for testing. The Genesee County Health Department also administers lead tests. Patients in need of transportation should contact 2-1-1 for assistance.
- Water Testing. Water testing is free through the City of Flint Water Testing Plant. Patients can call 810-787-6537 to learn more.
- WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the Genesee County WIC office at (810) 237-4537 to learn more.
- Child Development. If you have concerns about a child's growth, development or learning contact 2-1-1 for a Home Visiting Program in your area.

**GCHD and MDHHS Partner to Issue Guidance to Flint Parents, Providers**

FLINT, Mich. – In a joint effort to continue education within the community around lead exposure, the Genesee County Health Department (GCHD) and Michigan Department of Health and Human Services (MDHHS) today issued letters to parents and the provider community in Flint to assist in providing guidance to support families.

In response to the elevated blood lead levels found in some Flint children, GCHD and MDHHS have worked together closely to develop guidance for families and providers.

**GCHD QUOTE**

Parents are being provided information regarding lead testing, how to reduce lead exposure for your family, where lead comes from, and community and state resources for more information. Children can be exposed to lead from drinking water in lead pipes, old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass and jewelry making, and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.

“As we continue to find ways to educate and guide the Flint community towards reducing lead exposures, we are appreciate of the collaboration with Genesee County Health Department,” said Dr. Eden Wells, Chief Medical Executive with MDHHS. “Parents and providers can take a number of steps to help reduce exposure, identify signs of lead poisoning, and begin follow up care as needed. Working together we can all help to protect the health of families in Flint.”

Primary care providers can assist in helping to ensure that children and families exposed to lead receive the care and resources they need to manage the potential health impacts of lead poisoning. MDHHS and GCHD worked with Dr. Mona Hanna-Attisha of the Hurley Medical Center to develop testing protocols and guidance regarding identification of lead poisoning, management of elevated blood lead levels, follow-up care, and community and state resources.

GCHD and MDHHS issued the following recommendations for parents:

- Families who live in the City of Flint and are on the Flint water system or who attend school, childcare, or spend time with a caregiver in the City of Flint, are encouraged to get their children tested for lead poisoning at their doctor’s office or GCHD.
- Families can get their water tested for lead for free. Call 810-787-6537 for details about how.
- Families are encouraged to use a water filter in their home, and free filters are still available. Call 2-1-1 for information about where to pick up a free filter.
- Use filtered tap water for drinking (including making coffee, drink mixes, juice, baby formula), and cooking (even if you boil the water, the lead will stay in the water and food). Always use cold water when cooking.
- You can use unfiltered tap water for washing your hands, and washing dishes. If using unfiltered water, run the water for at least five minutes before you use it.
- Safe cleaning can also reduce the risk of lead exposure in the home. You can use unfiltered tap water for the following wiping down countertops, mopping floors, and washing clothes.

- Keep children away from lead paint and dust; use wet paper towels to clean up lead dust around windows, play areas and floors; and wash hands and toys often, using soap and water
- Lastly, always wash fruits with filtered water. Some foods help keep lead from being stored in the child's body, such as Calcium rich foods, Iron rich foods, and foods with Vitamin C.

GCHD and MDHHS will continue to provide more information to the community regarding reducing lead exposure and protecting the health of Flint residents. For more information, visit [www.michigan.gov/lead](http://www.michigan.gov/lead).

**This Document is a Non-Responsive Attachment.**

October 22, 2015

Dear Parent,

To help make sure the children of Flint are safe from lead exposure, the Genesee County Health Department and the Michigan Department of Health and Human Services want to help you understand:

- Where does lead come from?
- What can I do to protect my family?
- Should I get my child tested for lead?
- Where can I find more information about lead?

### **Where does lead come from?**

Lead is a serious health hazard, especially for small children who become lead poisoned when they eat, drink or breathe lead. Elevated levels of lead have been found in the drinking water from lead pipes in the City of Flint. Kids can also be exposed to lead from old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass, jewelry making and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.

### **Should my child get a blood lead test?**

Children who live in the City of Flint, live in a home using City of Flint water, or who attend school, childcare or often spend time with a caregiver in the City of Flint should be tested for lead poisoning. *This should be done as soon as possible.*

### **Where should I go to get a blood lead test for my child?**

The best place to get your child's blood lead test is your doctor's office. Your pediatrician will follow up with you on lab tests and provide you with information on what to do next. You can also have a lead test at the Genesee County Health Department. If you need transportation, contact 2-1-1 for help.

### **Understanding your child's lead test result.**

**A lead level below 5** means there is little or no lead in your child's blood. Use the tips below to help keep your child safe. Your doctor may suggest retesting your child within the next 12 months to make sure the level does not go up.

**A lead level of 5-14** means that your child has had some exposure to lead. Work with your doctor and local health department for further guidance on how to limit your lead exposure. Your doctor may retest your child in 1-3 months to make sure the level does not go up.

Children with very high levels of lead (**over 40**) may require treatment at the hospital.

### **What Can I Do to Keep My Family Safe?**

The following steps should be taken right away to help protect you and your child.

#### **Protecting your family from lead in the water:**

- Get your water tested for lead. It's free. Call 810-787-6537 to learn more.
- Use a water filter in your home. Call 2-1-1 for information on free water filters.
- If you do not have a water filter, use bottled water for drinking and mixing formula.
- Use filtered tap water for drinking (including making coffee, drink mixes, juice, baby formula), and cooking (even if you boil the water, the lead will stay in the water and food). Always use cold water when cooking.
- You can use unfiltered tap water for washing your hands, and washing dishes. If using unfiltered water, run the water for at least five minutes before you use it.

#### **Safe cleaning:**

Safe Cleaning is important. Keeping your home clean and safe from lead hazards will help to protect your family.

- You can use unfiltered tap water for the following wiping down countertops, mopping floors, and washing clothes.
- Keep children away from lead paint and dust.
- Use wet paper towels to clean up lead dust. Be sure to clean around windows, play areas and floors.
- Wash hands and toys often, using soap and water.

#### **Good nutrition:**

Some foods will help keep lead from being stored in a child's body. These are foods with a lot of calcium, iron and vitamin C. These foods include:

**Calcium Rich Foods**

**Iron Rich Foods**

**Foods with Vitamin C**

- |           |                                    |                 |
|-----------|------------------------------------|-----------------|
| ➤ Milk    | ➤ Beans                            | ➤ Oranges       |
| ➤ Cheese  | ➤ Lean meats like fish and chicken | ➤ Orange juice  |
| ➤ Yogurt  | ➤ Whole grain cereals              | ➤ Grapefruits   |
| ➤ Tofu    | ➤ Peanut butter                    | ➤ Tomatoes      |
| ➤ Spinach |                                    | ➤ Green peppers |

Always wash your fruits with filtered water. If you are concerned about your child's diet, talk with your pediatrician who may also recommend a daily multivitamin.

WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the **Genesee County WIC office at (810) 237-4537** to learn more. SNAP also offers a Double Bucks program to purchase even more healthy food for no additional costs.

PROVIDER DRAFT LETTER V.2

October 22, 2015

LoRocco Edits, Travis Edits, Attisha Edits, Peeler Edits

Cross checked with parent letter

Dear Provider:

As you may be aware from recent news reports, elevated levels of lead have been found in the City of Flint's water system.

To help protect the children of Flint from the current lead in water exposure, the Genesee County Health Department and Michigan Department of Health and Human Services are contacting you to assist you in providing guidance to support your families.

Children can be exposed to lead from drinking water in lead pipes, old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass and jewelry making, and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.

As a primary care provider, you play a critical role in helping to ensure that children and families exposed to lead receive the care and reassurances they need to manage the potential health impacts of lead poisoning.

**Identification.** Children suffering from lead poisoning often fail to present outward symptoms. However, early clinical symptoms can include anemia, anorexia, abdominal pain and constipation. Lead is a neuro-toxin, and exposure can result in violent and aggressive behaviors, lead to learning disorders, may cause Attention Deficit Hyperactivity Disorder (ADHD) and has been known to reduce IQ by as many as 5-8 points with levels as low as 10 ug/dL. Lead is metabolized through the gastrointestinal system similar to iron and calcium, with uptake rates depending on the size and weight of the child. The blood half-life of lead is short (approximately 1 month) but the bone half-life can extend into decades.

Due to multiple risk factors facing many residents in the City of Flint (including aging housing conditions and water quality), we recommend that all children under age 6 living in the City of Flint or living in homes that use Flint water, attending school or childcare in Flint, or who spend time with a caregiver in the City of Flint, receive a blood lead test. Blood lead testing should be done through a child's primary care doctor to ensure adequate short-term and long-term follow-up. ***Families should be encouraged to have their children tested immediately either at their doctor's office or the Genesee County Health Department.***

October 22, 2015

LoRocco Edits, Travis Edits, Attisha Edits, Peeler Edits

Cross checked with parent letter

**Management of Blood Lead Levels.** The following guidance is provided for management of childhood blood lead levels:

- **BLL < 5 ug/dL**
  - A lead level of less than 5 mcg/dL is not typically cause for concern.
  - Provide education and anticipatory guidance to ensure that lead levels do not rise.
  - Consider retesting in 12 months based on risk factors or concerns.
- **BLL > 5 ug/dL**
  - **Children with capillary results of 5 ug/dL and higher must have a confirmatory venous blood draw.**
  - Families should receive anticipatory guidance, nutrition counseling, instruction on safe cleaning techniques and appropriate follow-up care from their primary care provider.
  - In-home services including case management and environmental investigations are available for all children with lead levels greater than 5 ug/dL. Refer patients to the Genesee County Health Department for this service.
  - Children with confirmed venous testing results greater than 5ug/dL within the past 18 months must be retested based on Medicaid policy and AAP guidelines. (See attached "Provider Quick Reference). If a child has not been retested within these timeframes, retesting is recommended as soon as possible.
- **BLL > 44 ug/dL.**
  - **Children with capillary results of 5 ug/dL and higher must have a confirmatory venous blood draw.**
  - Lead levels over 44 ug/dL may require hospitalization. Consult with an expert at the Children's Hospital of Michigan in Detroit for additional guidance.
  - Families should receive anticipatory guidance, nutrition counseling, instruction on safe cleaning techniques and appropriate follow-up care from their primary care provider.
  - In-home services including case management and environmental investigations are available for all children with lead levels greater than 5 ug/dL. Refer patients to the Genesee County Health Department for this service.
  - Children with confirmed venous testing results greater than 5ug/dL within the past 18 months must be retested based on Medicaid policy and AAP guidelines. (See attached "Provider Quick Reference). If a child has not been retested within these timeframes, retesting is recommended as soon as possible.

**Reminder: All children covered by Medicaid must be tested at age 1 and 2.**

October 22, 2015

LoRocco Edits, Travis Edits, Attisha Edits, Peeler Edits

Cross checked with parent letter

**Follow-up Care.** As providers, there are steps you can take to help support your families:

1. Continue to educate families regarding lead risks and preventative steps that they can take to minimize their risks.
2. Encourage your families to use filtered water for drinking, mixing formula and washing dishes. Families can contact 2-1-1 for information on free water filters.
3. Healthy nutrition is critical for lead-exposed children. Make sure your patients are consuming balanced diets high in iron, calcium and Vitamin C. If you have concerns about their nutrition, consider recommending a multivitamin with iron. WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the Genesee County WIC office at (810) 237-4537 to learn more. In addition, SNAP offers a Double Bucks program that can provide healthy foods for less.
4. Breastfeeding is highly protective and encouraged. However, if the mother's blood lead level rises above 40ug/dL or her level is greater than 20 ug/dL and the baby has a level above 5 ug/dL breastfeeding is not recommended.
5. Because lead is a neuro-toxin, children with lead poisoning need longitudinal follow-up and may require developmental and behavioral health intervention services. Continue monitoring your patients' development at every visit.
6. Consider additional wrap-around and support services that will benefit your patients such as early childhood home visiting programs, early head start and head start. Call 2-1-1 for more information.

**Local Resources.** Several local resources are available to you and your patients:

- Blood Testing. Patients are encouraged to contact their primary care provider for testing. The Genesee County Health Department also administers lead tests. Patients in need of transportation should contact 2-1-1 for assistance.
- Water Testing. Water testing is free through the City of Flint Water Testing Plant. Patients can call 810-787-6537 to learn more.
- WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the Genesee County WIC office at (810) 237-4537 to learn more.
- Child Development. If you have concerns about a child's growth, development or learning contact 2-1-1 for a Home Visiting Program in your area.

## **Training, Testing, and Telling**

**816E05006**

### **Introducing the 3Ts for Reducing Lead in Drinking Water in Schools and Child Care Facilities**

#### **Introducing the 3Ts**

The 3Ts outreach program is in response to rising public concern over the health risks posed by elevated lead levels in the drinking water of our nation's schools and child care facilities.

In launching the 3Ts campaign, EPA's objective is to provide school officials and child care facility operators with the tools they need to understand and address lead in drinking water in their local communities:

**Training** – focuses on alerting school administrators, custodians, utilities and water officials to the risks of lead poisoning and the means of mitigating those risks.

**Testing** – underscores the importance of monitoring lead levels in school and child care facility drinking water to identify and respond to any existing problems.

**Telling** – emphasizes the need to communicate with the public regarding all facets of the issue, from funding and initiating a testing protocol, to reporting results, if needed, and proposing a remediation strategy.

#### **A Collaborative Effort**

The EPA recognizes that schools, child care facilities and local government officials have limited budgets with which to address an increasing number of health and safety issues. Therefore, it is important to note that the 3Ts program is not an endorsement of new Federal mandates. It is, instead, a call for education, collaboration, and partnership-building to find necessary funding and encourage utilities to be more sensitive to public concern about water quality.

#### **Your 3Ts Toolkit**

To implement an outreach program of education and advocacy, our toolkit includes the following materials and resources. It is designed for easy adaptation to your local needs, either selectively or in its entirety.

**Page Two - Training, Testing, and Telling**

**Training**

- Fact Sheet
- Frequently Asked Questions
- National Resources and Information

**Telling**

- Template Introductory Letter to Parents and Caregivers
- Template Newsletter Articles (2)
- Ways to Display Onsite Information
- Organizing a Workshop or Open House
- Workshop Agenda and Discussion Guidelines
- Template Information Update Announcement
- Template Public Address
- Issue and Crisis Management Guidelines

**Testing**

- 3Ts for Reducing Lead in Drinking Water in Schools: Revised Technical Guidance
- 3Ts for Reducing Lead in Drinking Water in Child Care Facilities: Revised Guidance

## **Lead in Drinking Water**

### **What You Should Know to Protect Children in Your School or Child Care Facility**

#### **Environmental Protection Agency's Role in Safeguarding Drinking Water**

The U.S. Environmental Protection Agency (EPA) is responsible for ensuring the safety of our country's drinking water. EPA works together with state environmental or health agencies to accomplish this mission. Charged with this mandate, EPA is concerned about the potential for elevated lead levels in the drinking water of schools and child care centers, which serve those most vulnerable to the health risks of lead exposure – *our nation's children*.

#### **Why Schools and Child Care Facilities Are of Concern**

EPA is reaching out to schools and child care centers across the country because there are a number of factors which may result in children's exposure to lead in these facilities;

- ◆ The extended periods of time children spend in school and child care facilities.
- ◆ The age of buildings, plumbing and fixtures that are subject to corrosion and the leaching of lead into drinking water.
- ◆ The on again/off again water use patterns that promote corrosion as water stands in plumbing pipes when it's not in use.

#### **Lead and Public Health**

Lead is a toxic metal that can be harmful to human health when ingested or inhaled. Even in very small doses, lead can pose a health threat. Childhood lead exposure may interfere with red blood cell chemistry and impair the development of the brain and central nervous system. Adverse effects may include delays in normal physical and mental development in babies and young children as well as deficits in attention span, hearing, and learning abilities.

Lead will also be stored in bones to be released later into the bloodstream. Fetuses and young children up to the age of six are most at risk because their growing bodies tend to absorb more lead than the average adult.

#### **Federal Regulation of Lead in Drinking Water**

**Safe Drinking Water Act (SDWA):** Passed in 1974, this federal law requires EPA to establish regulations for known or potential contaminants in drinking water, including lead. Under SDWA, regulations developed by EPA apply to public water systems. Schools and child care facilities

### Page Two - Lead In Drinking Water

that are served by a public water system are not subject to SDWA monitoring and treatment requirements because these schools and child care facilities are not considered public water systems.

**Under the Safe Drinking Water Act, lead is regulated by the following provisions:**

◆ **The 1986 SDWA Lead Ban:** This provision of the SDWA requires the use of "lead-free" pipe, solder, and flux in the installation or repair of any public water system or any plumbing in a residential or non-residential facility providing water for human consumption. Solders and flux are considered to be lead-free when they contain less than 0.2 percent lead. Before this ban took effect on June 19, 1986, solders used to join water pipes typically contained about 50 percent lead. Pipes and pipe fittings are considered "lead-free" under the Lead Ban when they contain less than 8 percent lead. Plumbing fixtures that are not "lead-free" were banned from sale after August 6, 1998. Plumbing fixtures are subject to the NSF International standard.

◆ **The 1988 Lead Contamination Control Act (LCCA):** The purpose of the LCCA is to reduce lead exposure and the health risks associated with it by reducing lead levels in drinking water at schools and child care centers. The LCCA created lead monitoring and reporting requirements for all schools, and required the replacement of drinking water fixtures that contained excessive levels of lead (see Appendix E of the 3Ts for Reducing Lead in Drinking Water in Schools: Revised Technical Guidance for a listing of these fixtures). The provisions are not enforceable. As a result, states have the option to voluntarily enforce the provisions of the Act (or alternate provisions) through their own authority.

◆ **The 1991 Lead and Copper Rule (LCR):** The LCR requires public water suppliers to monitor for lead in drinking water and to provide treatment for corrosive water if lead or copper are found at unacceptable levels. EPA strongly recommends that schools test their facilities for lead. However, unless a school owns its public water system, testing for lead and copper within the school is not specifically required. Therefore, many schools served by water systems owned by cities, towns, or other entities may have never been tested for lead under the LCR.

### **EPA Call to Action**

EPA hopes to reach out to schools and child care facilities in order to educate them regarding the benefits of testing. In an effort to encourage school districts to take action, EPA is spearheading a **3Ts for Reducing Lead in Drinking Water in Schools and Child Care**

**Facilities** outreach campaign. Nonregulatory in nature, this initiative calls for school districts and child care centers nationwide to launch their own proactive campaigns of education, prevention, testing and remediation to minimize the threat of lead exposure from drinking water and help ensure the safety of both the children and adults that use their facilities.

### **The Importance of Testing**

The best way to find out if a school or child care center has high levels of lead in the drinking water is to test the water. A testing program can identify if lead levels are near the EPA level of concern, identify the source of lead, and target the most effective, timely and cost-efficient methods of remediation.

**An effective drinking water sampling and monitoring program incorporates the following:**

- ◆ Designating a person to coordinate all activities.
- ◆ Developing a plumbing profile and performing targeted follow-up testing to identify sources of on-site lead contamination.
- ◆ Developing a drinking water sampling plan.
- ◆ Using a certified laboratory for analysis.
- ◆ Water testing at all on-site potable water outlets accessible to students and staff for drinking, cooking, or making coffee and other hot beverages.
- ◆ Taking remedial action to correct any problems identified.
- ◆ Establishing a schedule for periodic follow-up sampling to monitor lead levels.
- ◆ Initiating an ongoing program of communication with students, parents, staff, and the community at large to keep all concerned audiences informed of the proactive steps being taken to minimize possible exposure to lead in the facility's drinking water.
- ◆ Managing records in a central location.

## **Frequently Asked Questions**

---

### **Lead Exposure: the Risks and Remedies**

**Q. What is lead?**

**A.** Lead is a naturally occurring toxic metal that is harmful if inhaled or swallowed. Lead can be found in air, soil, dust, food, and water. Lead is commonly used in plumbing materials and water service lines. Exposure to elevated lead levels can result in adverse health effects, especially in fetuses, infants and children up to the age of six.

**Q. How does lead get into a school or child care center's drinking water?**

**A.** Typically, the lead in plumbing pipes, solder and other plumbing materials, such as water coolers and faucets, is the source of lead in drinking water. The most common cause is corrosion. Corrosion is a chemical reaction between the water and the lead pipes and solder. Corrosion is accelerated by water characteristics such as low pH (acidity), low mineral content, high temperature, and extended contact time with plumbing pipes. For example, corrosion accelerates when water in the plumbing system stands overnight, over the weekend, and throughout term breaks when there are no classes.

**Q. If testing and monitoring the quality of drinking water is not specifically mandated by state or local law, why should a school or child care center devote resources to such a course of action?**

**A.** School and child care administrators have a professional responsibility to ensure the health and safety of the children entrusted to their care. Ensuring that the water provided in the facilities is safe for children to drink is a fundamental responsibility that must be proactively addressed. Moreover, in addition to the health advantages, schools and child care facilities that voluntarily sample drinking water and make lead levels and remediation plans available to the public will enjoy the following benefits:

- Enhanced credibility
- Positive publicity
- Parental and community support
- Stature as a standard-setting "best practices" facility

**Q. What are the health risks associated with lead exposure?**

**A.** Lead poses a significant health risk to young children, especially infants and fetuses, where the danger is very severe. This is because growing children absorb lead more rapidly and are negatively impacted by a level of lead exposure that would have little effect on an adult. A child's mental and physical development can be irreversibly impaired by over-exposure to lead. EPA estimates that drinking water can make up 20% or more of a person's total exposure to lead. Infants who consume mostly mixed formula can receive 40% to 60% of their exposure to lead from drinking water.

**Q. How much lead in drinking water is too much?**

**A.** In school or child care settings, EPA has set a guidance level of 20 ppb (0.020 mg/L) when testing 250 ml first-draw samples from water fountains and outlets. (First draw refers to the first water to come out of the tap after an 8-18 hour period of inactivity.) When results show lead levels exceeding 20 ppb, those fountains and outlets should be taken out of service until remediation is complete.

**Q. Is lead exposure at schools significant to my child's health?**

**A.** The Centers for Disease Control and Prevention (CDC) recommend that as a community we should reduce all sources of lead exposure as much as possible, because it can have adverse health effects even at low concentrations. The school may take actions to reduce lead exposure in their facilities, but parents also should realize that exposure to lead may occur in the home. Actions in the home to reduce lead exposure are just as important as the step the school is taking to reduce lead.

**Q. What is remediation?**

**A.** Remediation refers to the short- and long-term steps that can be taken to reduce the levels of lead in drinking water if test results indicate that a school or child care facility has a lead problem. The implementation of remediation plans is impacted by many factors, including cost, likelihood of success, availability of water, and staffing requirements.

Page Three - **Frequently Asked Questions**

**Q. If a problem is identified at a school or child care center, what are the options available for reducing lead levels in the drinking water?**

**A.** Based on available human and financial resources, the following routine, short-term and long-term steps will help mitigate the problem:

**Routine Control Measures**

Below are examples of routine activities that should be conducted to prevent exposure to elevated levels of lead:

- Clean debris from all accessible screens frequently. If you discovered sediments in faucet screens, have the sediments tested for lead and continue to clean your screens frequently, even if the analysis finds no lead.
- Use only cold water for food and beverage preparation. Hot water will dissolve lead more quickly than cold water and is likely to contain increased lead levels. If hot water is needed, it should be taken from the cold water tap and heated on a stove or in a microwave oven.
- Instruct the users (students and staff) to run the water before drinking or staff could run the water before students arrive, so they are drinking water that has not been in contact with the faucet interior since faucets are often a major source of lead in drinking water.
- Placard bathroom sinks with notices that water should not be consumed. You should use pictures if there are small children using bathrooms.

**Interim (Short-Term) Control Measures**

(Please see the *3Ts for Reducing Lead in Drinking Water in Schools* for a more detailed description of the interim control measures.)

- "Flush" the piping system in your building.
- Provide bottled water.
- Shut off problem outlets.

## **Permanent Remedies**

After obtaining an understanding of your water supply and the lead conditions in your facility (as a result of testing), you should examine the permanent treatment options and select those most appropriate to your situation. (Please see the *3Ts for Reducing Lead in Drinking Water in Schools* for a more detailed description of the permanent remedies.)

- 💧 Replace outlets.
- 💧 Reduce lead levels at the tap. For example, install point-of-use (POU) devices that reduce lead at the tap.
- 💧 Check grounding wires. Electrical current may accelerate the corrosion of lead in piping materials.
- 💧 Lead pipe replacement. Lead pipes within the school and those portions of the lead service lines under the water supplier's jurisdiction can be replaced.
- 💧 Reconfigure plumbing. In some facilities, the plumbing system might be modified so that water supplied for drinking or cooking is redirected to bypass sources of lead contamination.
- 💧 Manual flushing. Flushing individual problem outlets or all outlets may also represent a permanent, albeit ongoing, solution.
- 💧 Automated flushing. Time-operated solenoid valves can be installed and set to automatically flush the main pipes (headers) of the system.
- 💧 Bottled water. If other treatment fails or is impractical, bottled water can be purchased for consumption by the building community.
- 💧 Use lead-free materials. Make sure that any plumber who does repair or replacement work on the facility's plumbing system uses only "lead-free" solders and other materials.
- 💧 Shut off problem outlets.

## **National Resources and Information**

### **Local Resources**

Secure the following information from these local sources:

- ◆ Local Water Supplier (contact name and number)
  - ◆ Annual water quality report (Consumer Confidence Report)
  - ◆ Details about how your water is treated
  - ◆ Lead public education materials (if the water systems exceeded lead action levels)
- ◆ State Department of Health/Environment (contact name and number)
  - ◆ Lead and drinking water public health information
  - ◆ State lead-in-drinking-water regulatory guidelines
  - ◆ Testing children for blood lead levels
  - ◆ List of laboratories certified for analysis of lead in drinking water samples

### **National Toll-Free Hotlines**

## How to Collect

---

### an Initial Sample

- **Collect the sample before any water has been used. Water should not be used for 8-18 hours before sampling.**
- Make sure you have clean hands.
- Complete the sample recording form.
- Only use containers (250 milliliter) supplied by your certified lab.
  - Containers should not be opened until you are ready to collect the sample.
  - Sampling containers that have been compromised in any way, e.g., by being touched on the threads or the interior surfaces, must not be used.
  - Keep food and drink away from the sample and its container.
  - If you are collecting a sample from a faucet, aerators and screens should be removed before taking samples.
  - Anything attached to the end of the faucet, e.g., hoses, should be removed before taking samples.
- Make sure no water has been withdrawn from the tap or water fountain before you collect the sample.
- Place the container under the faucet or drinking water fountain that is being tested and collect 250 milliliters of water.
  - If a faucet is being tested make sure you turn on the cold water tap.
- Turn on the water and fill the container without allowing any water to run down the drain.
- Close the container according to the instructions from your certified lab.
- Make sure the container is labeled with the same information from your sample recording form.
- Prepare the container for shipping according to the certified lab's instructions.
- Ship containers according to the certified lab's instructions.
- Samples must be delivered to the lab within 14 days of collection for proper testing.

## a Flush (Follow Up) Sample

- **Collect the sample first thing in the morning before any water has been used. Water should not be used for 8-18 hours before sampling.**
- Make sure you have clean hands.
- Complete the sample recording form.
- Only use containers (250 milliliter) supplied by your certified lab.
  - Containers should not be opened until you are ready to collect the sample.
  - Sampling containers that have been compromised in any way, e.g., by being touched on the threads or the interior surfaces, must not be used.
  - Keep food and drink away from the sample and its container.
  - If you are collecting a sample from a faucet, aerators and screens should be removed before taking samples.
  - Anything attached to the end of the faucet, e.g., hoses, should be removed before taking samples.
- Make sure no water has been withdrawn from the tap or water fountain before you collect the sample.
  - If a faucet is being tested make sure you turn on the cold water tap.
- Turn on the water for the faucet or drinking water fountain and let it run down the drain for 30 seconds (you may be asked to run the water for a different length of time – make sure you run the water for the time instructed).
- Place the container under the faucet or drinking water fountain that is being tested and collect 250 milliliters of water.
- Turn on the water and fill the container without allowing any water to run down the drain.
- Close the container per instructions from your certified lab.
- Make sure the container is labeled with the same information from your sample recording form.
- Prepare the container for shipping per the certified lab's instructions.
- Ship containers per the certified lab's instructions.
- Samples must be delivered to the lab within 14 days of collection for proper testing.

## **Organizing a Lead in Drinking Water Workshop or Open House**

### **Agenda and Discussion Guidelines**

A workshop or open house provides the ideal forum for sharing information, dispelling misconceptions, and allowing guests to voice their concerns. Because the issues are complex, we encourage you to introduce a series of such events. To bolster attendance, tie the workshop in with regularly scheduled events such as PTA meetings.

#### **Tasks/Activities to do prior to the workshop:**

##### **1) Form an Organizing Committee**

Create an organizing committee to oversee planning, promotion, implementation, and follow-up in newsletters. This committee should draw from a variety of concerned groups, including: teachers, parents, students (pre-teens and teens), school board members, public health officials, chamber of commerce, drinking water system representatives, local civic leaders, etc.

##### **2) Seek out Partnerships**

Leverage the contacts of your organizing committee to secure workshop/open house partners willing to support your efforts and help with costs for printing, promotion, audiovisual aids, etc. Pursue partnerships with commercial and not-for-profit entities (e.g., testing laboratory, advocacy group, etc.) that have a significant stake in the lead in drinking water issue.

##### **3) Develop an Agenda**

Keep your formal presentation to 45 minutes, allowing another 15 minutes for speakers to take questions from the floor.

##### **4) Special Equipment to Consider**

- Audiovisual aids
- Podium
- Microphone and sound system
- Portable microphone for Q&A session
- Recording or videotaping equipment
- Additional seating

Page Two - Organizing a Lead in Drinking Water Workshop or Open House

**5) Promoting the Workshop**

To secure the broadest awareness of your workshop or open house, you may want to use the *Lead in Drinking Water* announcement (Refer to Information Update Announcement or Letter in your toolkit).

**During the Workshop:**

**6) Provide Brochures and Handouts**

- 💧 Distribute a workshop agenda. List your discussion topics and speakers, providing brief biographies that include academic and professional credentials as well as contact information.
- 💧 Also make available your *Lead in Drinking Water* display pamphlets and handouts (Refer to "Ways to Display Onsite Information" in your toolkit).

**7) Document the Workshop Proceedings**

Take notes, record or videotape your workshop/open house presentation. Doing so will accurately document:

- 💧 What and how the issues were presented and received
- 💧 Attendee interest and participation
- 💧 Questions asked and answers provided
- 💧 What decisions or courses of action were proposed
- 💧 What commitments were made
- 💧 What follow-up action is necessary

**After the Workshop:**

**8) Follow-up Publicity**

**Newsletter Follow-up:** Run your workshop/open house success story in your own newsletter and distribute it for inclusion in the newsletters of partner organizations as well as neighborhood homeowner's associations, service clubs, major employers, community centers and environmental groups.

## Additional Information:

### Sample Agenda and Discussion Guidelines

These guidelines are designed to engage your audience, garner support and enhance public trust. The potential health effects of exposure to elevated lead levels is a complex issue that must be presented clearly and honestly. Your overriding message should resonate as an endorsement of education, transparency and full disclosure.

### Sample Agenda

- Welcome by Principal or School Superintendent <or head of the Department of Health which licenses Child Care Centers>

Welcoming remarks should provide a brief overview of EPA's **3Ts for Reducing Lead in Drinking Water in Schools and Child Care Facilities** call to action and your facility's proactive response.

- Introduction by School Principal or Child Care Administrator
  - ◆ Thank guests for attending to hear and be heard.
  - ◆ Introduce the experts who will be participating in the presentation. Speakers should include authorities drawn from the following sources:
    - School Board
    - Local Water Utility/Supplier
    - Healthcare Professionals
    - Building and Engineering Community

- Discussion and Presentations by Speakers

These are suggested areas of discussion. Speakers should be candid and comprehensive but concise, avoiding the use of unfamiliar acronyms and complicated technical language.

### Question & Answer Session

The school principal or child care administrator should open the floor to questions and direct questions to the appropriate expert.

Page Four - **Organizing a Lead in Drinking Water Workshop or Open House**

**Q. What is lead?**

**A.** Lead is a toxic metal commonly used in plumbing materials and water service lines. When ingested or inhaled, high levels of lead can produce lead poisoning, which poses the greatest health risk to fetuses, infants and children up to the age of six.

**Q. How are children and adults exposed to lead?**

**A.** There are a number of sources that can produce excess lead exposure. These include lead-based paint; lead in the air from industrial emissions, dust and soil; lead in food from crops or lead glaze on imported dinnerware; lead dust brought home by industrial workers on their shoes and clothing; and lead in water as a result of the corrosion of plumbing materials containing lead.

**Q. How does lead get into drinking water?**

**A.** Typically, the lead in plumbing pipes, solder and other plumbing materials is the source of lead in drinking water. The most common cause is corrosion. Corrosion is a chemical reaction between the water and the lead pipes and solder. Corrosion is accelerated by water characteristics such as low pH (acidity), low mineral content, high temperature, and extended contact time with plumbing pipes. For example, corrosion accelerates when water in the plumbing system stands overnight, over the weekend, and throughout term breaks when there are no classes.

**Q. What health risks are associated with lead?**

**A.** Lead poses a significant health risk to young children, especially infants and fetuses, where the danger is very severe. This is because growing children absorb lead more rapidly and are negatively impacted by a level of lead exposure that would have little effect on an adult. A child's mental and physical development can be irreversibly impaired by over-exposure to lead. EPA estimates that drinking water can make up 20% or more of a person's total exposure to lead. Infants who consume mostly mixed formula can receive 40% to 60% of their exposure to lead from drinking water.

**Q. Who are the most at-risk populations and why?**

- A.** Young children, infants and fetuses are most at-risk. This is due to a number of factors:
- 💧 The extended periods of time children spend in school and child care facilities.
  - 💧 The age of buildings, plumbing and fixtures that are subject to corrosion and the leaching of lead into drinking water.
  - 💧 The on again/off again water use patterns that promote corrosion as water stands in plumbing pipes when systems are not in use.

**Q. How does a school or child care facility proceed with lead testing?**

**A.** Before testing and taking corrective action, it is essential to assess the status of the plumbing system and identify any factors that might contribute to lead contamination. To do this, a plumbing profile must be developed.

The plumbing profile helps administrators understand whether they have a widespread contamination problem or only localized concerns. It also helps identify and prioritize sample sites, giving the following top priority: drinking fountains, kitchen sinks, home economics rooms, teacher's lounge sinks, nurse's office sink, classroom sinks in special education classrooms, and any sink visibly used for consumption.

It is important to note that large variations in lead concentrations may be found among individual outlets in a facility because of differences in flow rates and/or building materials used.

If potential problems are identified through the completion of a plumbing profile, the next step is to have the water tested. A sampling plan is developed that indicates where to take samples and how to prioritize the sample sites. In most cases, a laboratory or consultants are retained to conduct the testing in adherence to EPA sampling protocols designed specifically for schools and child care facilities. After that, a certified laboratory conducts sample analyses to ensure the accuracy of the results, which should be made public immediately.

**Q. How much lead is too much?**

**A.** In school or child care settings, EPA has set a guidance level of 20 ppb (0.020 mg/L) when testing 250 ml first-draw samples from water fountains and outlets. (First draw refers to the first water to come out of the tap after an 8-18 hour period of inactivity.) When results show lead

Water Testing and Treatment for Lead in Drinking Water

levels exceeding 20 ppb, those fountains and outlets should be taken out of service until remediation is complete.

**Q. How safe is this facility's source water?**

**A.** While EPA and state governments set and enforce standards, local governments and private water suppliers have direct responsibility for the quality of the water that ultimately flows through the tap into homes, businesses, office buildings, schools and child care centers.

Water systems test and treat their water, maintain the distribution systems that deliver water to consumers, and report on their water quality to the state. States and EPA provide technical assistance to water suppliers and can take legal action against systems that fail to provide water that meets state and EPA standards.

As a result of this "multiple barrier" approach to drinking water protection, our source water meets or exceeds all regulatory standards. By way of documentation, we are making available our supplier's Annual Water Quality Report, so be sure to pick up a copy on your way out.

**Q. How safe is this facility's plumbing system? (Optional)**

**A.** We believe our plumbing system is safe. Nevertheless, we want to be absolutely certain our drinking water does not pose a health risk to children or adults. That is why we are responding to EPA concerns with this initiative to reduce the potential for lead exposure from our drinking water.

**Q. What can be done immediately, short-term, and on a long-term basis to minimize the potential lead risk from onsite drinking water? (Optional)**

**A.** Based on available human and financial resources, the following routine, short-term and long-term steps can be taken to help mitigate the problem:

### Step 1: Organizing a Lead in Drinking Water Workshop or Open House

#### **Routine Control Measures**

Below are examples of routine activities that should be conducted to prevent exposure to elevated levels of lead:

- 💧 Clean debris from all accessible screens frequently. If you discovered sediments in faucet screens, have the sediments tested for lead and continue to clean your screens frequently, even if the analysis finds no lead.
- 💧 Use only cold water for food and beverage preparation. Hot water will dissolve lead more quickly than cold water and is likely to contain increased lead levels. If hot water is needed, it should be taken from the cold water tap and heated on a stove or in a microwave oven.
- 💧 Instruct the users (students and staff) to run the water before drinking or staff could run the water before students arrive, so they are drinking water that has not been in contact with the faucet interior since faucets are often a major source of lead in drinking water.
- 💧 Placard bathroom sinks with notices that water should not be consumed. You should use pictures if there are small children using bathrooms.

#### **Interim (Short-Term) Control Measures**

(Please see the *3Ts for Reducing Lead in Drinking Water in Schools* for a more detailed description of the interim control measures.)

- 💧 "Flush" the piping system in your building.
- 💧 Provide bottled water.
- 💧 Shut off problem outlets.

#### **Permanent Remedies**

After obtaining an understanding of your water supply and the lead conditions in your facility (as a result of testing), you should examine the permanent treatment options and select those most appropriate to your situation. (Please see the *3Ts for Reducing Lead in Drinking Water in Schools* for a more detailed description of the permanent remedies.)

- 💧 **Replace outlets.**
- 💧 **Reduce lead levels at the tap.** For example, install point-of-use (POU) devices that reduce lead at the tap.

Page Eight - Organizing a Lead in Drinking Water Workshop or Open House

- **Check grounding wires.** Electrical current may accelerate the corrosion of lead in piping materials.
- **Lead pipe replacement.** Lead pipes within the school and those portions of the lead service lines under the water supplier's jurisdiction can be replaced.
- **Reconfigure plumbing.** In some facilities, the plumbing system might be modified so that water supplied for drinking or cooking is redirected to bypass sources of lead contamination.
- **Manual flushing.** Flushing individual problem outlets or all outlets may also represent a permanent, albeit ongoing, solution.
- **Automated flushing.** Time-operated solenoid valves can be installed and set to automatically flush the main pipes (headers) of the system.
- **Bottled water.** If other treatment fails or is impractical, bottled water can be purchased for consumption by the building community.
- **Use lead-free materials.** Make sure that any plumber who does repair or replacement work on the facility's plumbing system uses only "lead-free" solders and other materials.
- **Shut off problem outlets.**

**Q. What is this facility's timeline for conducting testing and taking action as necessary?**

**A.** We are currently developing an effective drinking water sampling and monitoring program. We are working with state and local water authorities to formulate our strategy, and we are coordinating with the school district to begin sampling if the results of our plumbing profile indicate that a health risk exists. However, we have already initiated a program of communication with students, parents, staff and the community at large. This communication is designed to keep all concerned audiences informed of the proactive steps being taken to minimize possible exposure to lead in this facility's drinking water.

**Q. How can parents minimize their child's overall exposure to lead?**

**A.** As there are other common sources of lead exposure that are in the control of individual caregivers, these precautions are recommended:

- Wash children's hands and toys frequently and try to keep your children from putting anything other than food in their mouths.
- Homes built before 1978 are likely to have lead based paint in them. In order to reduce lead exposure from deteriorated lead-based paint, keep floors, window frames, windowsills and other surfaces in the home clean and free of dust.

### • 3Ts for Reducing Lead in Drinking Water Workshop or Open House

- Don't bring lead dust into the house from your workplace or hobby. Make sure your child eats a healthy, well-balanced diet.
- Don't store food in high-lead pottery.
- Anytime the water in a particular faucet has not been used for six or more hours, "flush" your cold-water pipes by running the water until it becomes as cold as it will get. The more time water has been sitting in your home's pipes, the more lead it may contain. But be aware that flushing may not be effective in high-rise buildings with lead-soldered central piping.
- Use only water from the cold-water tap for drinking, cooking, and especially for making baby formula, as hot water is more corrosive and therefore likely to contain higher levels of lead.
- Have your water tested for lead and other contaminants. That is the only way to know how great a risk your home drinking water poses for the children and adults in your household.

#### **Q. How can parents test for lead in home drinking water?**

**A.** Have your water tested for lead by a certified laboratory. To assist you, we are making available a list of EPA-certified laboratories in the area, so please pick up a handout before you leave.

Household testing costs between \$20 and \$100. Because you cannot see, taste, or smell lead dissolved in water, testing is the only sure way to find out whether there are harmful quantities of lead in your home drinking water.

You should be particularly suspicious if your home has lead pipes (lead is a dull gray metal that is soft enough to be scratched easily with a house key), if you see signs of corrosion (frequent leaks, rust-colored water, and stained dishes or laundry), or if your non-plastic plumbing is less than five years old.

Your water supplier may have useful information, including whether the service connector used in your home or area is made of lead. Additionally, testing is especially important in high-rise buildings where flushing might not work.

#### **Q. How can parents have their child's blood lead level tested?**

**A.** Even if your children seem healthy, take them to a pediatrician for a blood test. The sample will be sent to a lab, and you'll have the results in a few days.

Page Ten - Organizing a Lead in Drinking Water Workshop at Your House

While lead exposure may result in symptoms such as stomachaches, loss of appetite, inability to sleep and hyperactivity, far too often, the symptoms are much more subtle, but may be long-lasting and irreversible. To be on the safe side, please make sure that your children are tested for lead exposure.

**Q. In the months ahead, how will this facility keep parents and caregivers informed?**

**A.** To keep you informed, this is just the first in a series of workshops <name of school or child care facility> will be presenting to bring the issue to the forefront. We've also set up a *Lead in Drinking Water* Information Display in our main office, where pamphlets and other resources are available throughout the school day. We'll be making updates available to you as new information becomes available, and we invite you to contact us at <telephone number> or <email address> if you have questions or wish to provide input.

**Q. What can parents do to support this facility's lead-awareness program?**

**A.** Getting involved is the most important way to support our efforts. Attend future workshops. Take advantage of the information we're making available. Educate yourselves and discuss the issue with fellow parents and community members. Volunteer your time to help us promote our awareness initiative. And lastly, contribute your expertise as a business, education or healthcare professional by participating in future workshops or by manning our information center and help line.

Before you leave, please sign our clipboard and provide your contact information if you wish to volunteer for our awareness campaign.

## Public Address

### *Issue of Lead in Facility Drinking Water*

I would like to tell you about [name of the school/child care center]'s plans to assess, and if necessary, reduce lead in our facility's drinking water. We are taking this course of action on a voluntary basis because it is the right thing to do in order to ensure that this facility remains a safe environment for both youngsters and adults.

The United States Environmental Protection Agency (EPA) is encouraging schools [child care centers] to reduce children's exposure to lead from facility drinking water by taking steps that include: testing drinking water for lead; disseminating results to parents, students, staff and other interested stakeholders; and taking appropriate and necessary actions to correct problems.

Exposure to lead is a concern because it is a toxic metal that has a range of adverse health effects, from lowered birth weight and slowed physical and mental development in infants, to lowered IQ levels, impaired hearing, reduced attention span, and poor classroom performance in young children.

Typically, when lead is found in drinking water at unacceptable levels it is from leaching from plumbing materials.

To safeguard our students [children], EPA recently launched a **3Ts for Reducing Lead in Drinking Water in Schools and Child Care Facilities** campaign aimed at encouraging voluntary actions to reduce potential exposure to lead in drinking water. In response, [name of your school] is taking decisive 3Ts action as follows: [note: suggested training, testing, telling actions]

- We are launching an education and awareness initiative to provide **training** to school personnel, parents, custodians and the community at large regarding the risks of lead poisoning and the means of mitigating those risks.
- We are developing a sampling plan so we can conduct **testing** at outlets where students and staff get water for drinking and cooking.
- We are **telling** you, our students' parents and caregivers, the actions we're taking to minimize your child's exposure to lead in drinking water.

Schools <child care centers> like ours, that receive water from a water utility, are not required by state or federal regulations to test for levels of lead in onsite drinking water. It is the responsibility of our water utility to control the corrosivity of the water in order to reduce the likelihood of lead leaching from plumbing, fixtures, solders, and other materials.

However, individual school plumbing may still leach lead. Therefore, in light of increased concern about the possible health effects posed by elevated levels of lead, we are taking the initiative to ensure the drinking water in our facility is safe.

OPTIONAL (Recognizing that communication is key, a *Lead in Drinking Water* Information Display is being set in our main school office. Here, free EPA materials, school handouts and issue updates will be available throughout the day.

We are also in the process of creating a staffed information center in our library, where parents will be able to ask questions, get answers and offer input. )

OPTIONAL (Additionally, we will be scheduling a Lead in Drinking Water Workshop in conjunction with an upcoming <PTA meeting or open house>, so watch for further information about all these activities.)

If you have any immediate concerns or would like to support our effort as a volunteer, please contact us at <telephone> or <email address>.

Meanwhile, if you are concerned about the level of lead to which your children are exposed from drinking water at home, take these precautions:

- Anytime the water in a particular faucet has not been used for six or more hours, “flush” your cold-water pipes by running the water until it becomes as cold as it will get. The more time water has been sitting in your home’s pipes, the more lead it may contain. But be aware that flushing may not be effective in high-rise buildings with lead-soldered central piping.

- Use only water from the cold-water tap for drinking, cooking, and especially for making baby formula, as hot water is more corrosive and therefore likely to contain higher levels of lead.
- Have your water tested for lead and other contaminants. That is the only way to know how great a risk your home drinking water poses for the children and adults in your household.

If you decide to test your home water, use a certified laboratory. To assist you, we are making available a list of state certified laboratories in the area, so please pick up a handout before you leave.

I would only add that numerous health, security and educational issues currently compete for our limited resources. It is a great challenge to devote the appropriate attention and find the necessary funding to address all these pressing issues.

Furthermore, voluntary onsite water testing presents a special challenge because the testing itself may be costly, and should a problem be discovered, fixing the problem may be even more costly. We will be prioritizing our activities to ensure we have the resources necessary.

In the meantime, as we move forward, we'll be turning to a variety of partners for resources and expertise, including our water utility, state drinking water program, local health office, certified area laboratories, and local community organizations.

To date, community wide response to our awareness initiative has been tremendous. As we proceed and develop a specific course of action, we intend to keep parents and the public at large informed every step of the way.

If you have further questions about this issue and how we are addressing it, please feel free to discuss them with me. And for further information, please write down these toll-free EPA numbers:

- Consumer Information – (800) 424-LEAD
- Safe Drinking Water Hotline – (800) 426-4791
- State Department of Health - < insert phone number>
- Local Department of Health - < insert phone number>

On behalf of the administration of <School / Child Care Center>, many thanks for your involvement and support.

## Ways to Display

---

### Onsite Information

#### Objective:

An onsite *Lead in Drinking Water* information display serves as a very visible sign that your school or child care center is taking the initiative on this issue. Furthermore, it does not have to be elaborate to be effective. Your display can range from a simple bulletin board or table in the main office where pamphlets are available, to a professional-style kiosk and even a manned information center. Select the option that works best for your facility based on available time and resources.

#### Options:

##### 1. Bulletin Board or Table Display

- 💧 Locate in or near the main administration office.
- 💧 Feature student-made signage or art (Suggested theme: What Drinking Water Means to Me).
- 💧 Make information easily available for quick pick-up.

##### 2. Entrance Display

- 💧 Locate by main entrance.
- 💧 Kiosk-style trade-show unit with racks or plastic sleeves to hold pamphlets and handouts.
- 💧 Feature a banner, art and/or photography by students (Theme: What Drinking Water Means to Me).
- 💧 Rotate student art and/or photography to encourage parents to come in and see their child's work on display.
- 💧 Make information easily available for quick pick-up.

Page Two - Ways to Display Onsite Information

- ◆ Include a clipboard where visitors can sign up for email updates as new information becomes available.

**3. Manned Library Display**

- ◆ Information table skirted with student-decorated art and/or photography (Theme: What Drinking Water Means to Me).
- ◆ Staff during designated morning drop-off, lunchtime, or afternoon pick-up hours, either daily or on select days of the week as schedules allow.
- ◆ *Lead in Drinking Water* Volunteers: Assign teachers to staff your display or solicit volunteers, drawing from parents and your community's pool of knowledgeable talent, (i.e. retired teachers; college and university professors in the environmental sciences; professionals in the fields of medicine, public health, water treatment, engineering, plumbing and sanitation).
- ◆ Training: Have volunteers attend your *Lead in Drinking Water* Workshop. You may also want to have a separate orientation session so volunteers are completely familiar with the subject and your facility's plan of action. It is critical to public trust that everyone disseminating information knows the facts and presents your facility's position on the issues accurately and consistently.
- ◆ Include a clipboard where parents and other interested parties can sign up for email updates as new information becomes available.
- ◆ Have the librarian monitor the display to ensure it is staffed at assigned hours and well stocked with pamphlets and handouts.

**Information for Distribution:**

**Solicit relevant brochures and educational handouts from the following local sources:**

- xiii. Local water utility (Annual Water Quality Report or Consumer Confidence Report)
- xiv. State and local health agencies
- xv. Certified local water testing laboratories
- xvi. State drinking water program
- xvii. State and local environmental groups

Facility staff should review any brochures and educational handouts ahead of time to be sure they understand what information is being provided to parents and the public and that material is appropriate for the situation at their facility.

For additional distribution materials, refer to the toolkit's National Resources and Information section.

## Parent and Caregiver Letter

Date

Dear Parent or Caregiver:

We would like to tell you about our plans to reduce potential exposure to lead in drinking water in our facility. The United States Environmental Protection Agency (EPA) promotes healthy school [child care] environments and water quality is one component of a healthy environment. EPA is encouraging schools [child care centers] to reduce children's exposure to lead from facility drinking water by taking a number of steps. These include testing drinking water for lead; disseminating results to parents, students, staff and other interested stakeholders; and taking appropriate and necessary actions to correct problems.

Exposure to lead is a concern because it is a toxic metal that has a range of adverse health effects, from lowered birth weight and slowed physical and mental development in infants to lowered IQ levels, impaired hearing, reduced attention span, and poor classroom performance in young children.

To safeguard our students [children], EPA recently launched a **3Ts for Reducing Lead in Drinking Water in Schools and Child Care Facilities** campaign aimed at encouraging voluntary actions to reduce potential exposure to lead in drinking water. In response, [name of your school] is taking decisive 3Ts action as follows: [note: suggested training, testing, telling actions]

- We are launching an education and awareness initiative to provide **training** to school personnel, parents, custodians and the community at large regarding the risks of lead poisoning and the means of mitigating those risks.
- We are developing a sampling plan so we can conduct **testing** at outlets where students and staff get water for drinking and cooking.
- We are **telling** you, our students' parents and caregivers, the actions we're taking to minimize your child's exposure to lead in drinking water.

Recognizing that communication is key, a *Lead in Drinking Water* Information Display is being set up in the school office. Here, free EPA materials, school handouts, and issue updates will be available throughout the day. [optional :We're also in the process of creating a staffed information center in our library, where you'll be able to ask questions, get answers and offer input. ]

Optional [Additionally, we'll be scheduling a lead workshop in conjunction with an upcoming <PTA meeting or open house>, so watch for further information about all these activities as it is sent home with your child.]

If you have any immediate concerns or would like to support our effort as a volunteer, please contact us at <telephone> or <email address>.

We are committed to keeping you informed every step of the way as we implement the 3Ts at our school.

Sincerely,

Administrator

### LEAD IN DRINKING WATER INFORMATION DISPLAY

#### <School/Child Care Center> to Unveil *Lead in Drinking Water* Information Display

In recent days, concerns have been raised over the level of lead in the drinking water at <Anytown Elementary School>. In an effort to inform the community of ongoing efforts to protect children in our facility, parents and concerned community members will soon be invited to visit the school's new *Lead in Drinking Water* Information Display. Scheduled for introduction on <date>, the display will be located in the main <school/child care> office for easy access. Here, free pamphlets and handouts about lead in drinking water will be available throughout the school day.

In announcing the establishment of this information display, <School Principal/Child Care Administrator John Smith> noted, "The lead levels in <school/child care> drinking water are a growing public concern and we want to be proactive in responding. We're proud to be taking the initiative in keeping our parents and the community informed. Our *Lead in Drinking Water* Information Display is just the first step in our ongoing campaign of education and awareness."

[Optional: According to Mr. Smith, the <school/child care center> plans to open a second, staffed information center in the school library. This will give parents the opportunity to consult with school administrators and health authorities on lead in drinking water and the most effective ways to reduce exposure.]

The U.S. Environmental Protection Agency (EPA) recently launched a campaign to reach out to schools and child care centers across the country. This EPA initiative is focused on promoting voluntary testing of drinking water for lead, taking corrective action if problems are identified, and sharing testing results and plans for reducing lead exposure in drinking water with parents, staff, students, and the community at large.

Concluded <Mr. Smith>, "We are responding to EPA's voluntary call to action because we believe our children should have confidence in their drinking water while at our facility. Furthermore, we are committed to keeping our parents and the public informed as we work to ensure drinking water quality."

###

## Newsletter Article 2

### LEAD TESTING

#### <School/Child Care Center> Announces Lead Testing

The administration of <School/Child Care Center> has announced that it will be conducting on-site testing of drinking water outlets to check for elevated levels of lead. This voluntary testing is being conducted to ensure the health and safety of everyone who uses our facility, including children, parents, faculty and the community at large.

Schools and child care facilities that receive water from a drinking water system are not required by state or federal regulations to conduct sampling for lead. Nevertheless, the administration of <School/Child Care Center> has determined that it is in the public's best interest to take the initiative in dealing with this potential health risk. To that end, following instructions provided in an EPA guidance document designed especially for schools and child care facilities, we developed a plan for testing.

Having identified those drinking water outlets, testing is scheduled to take place on <time period> using EPA-approved instructions. These samples will then be analyzed by a certified laboratory. (Optional: During the sampling period, bottled water will be provided to all children and adults on the premises.)

We will share the results of our testing as soon as they are available. A copy of the test results will be posted in our administration office for review by parents, staff and the general community.

####

## Information Update Announcement

**Objective:** This postcard-style announcement is designed to provide an effective and affordable way to communicate with parents and caregivers on a regular basis. Your proactive approach will be most likely to garner support if you communicate with parents frequently and forthrightly.

Please note that having the announcement delivered, returned by the student, and signed by the parent will cut costs and help guarantee the information arrives at home. Having parents sign will ensure it receives appropriate attention.

### **FRONT:**

***We're looking out for your child by  
looking out for lead in drinking water!***

## **Issue and Crisis Management**

### **Guidelines**

#### **Objective:**

At the heart of an effective issue/crisis management plan is preparation and coordination to deliver information swiftly, professionally and consistently. Preventing issues from escalating into crises demands a proactive approach designed to shape public opinion, defuse flashpoints, and counter any actual or potentially negative, misleading or misinformed word-of-mouth and/or media coverage.

#### **1. Follow these communication guidelines for enhancing public perception.**

- ◆ Take the initiative in providing information.
- ◆ Make sure your information is honest, accurate and comprehensive.
- ◆ Speak with one consistent voice.
- ◆ Anticipate questions and concerns and address them proactively.
- ◆ Be positive and forthcoming.
- ◆ Keep your audiences up to date as new information becomes available.

#### **2. Form an issue/crisis management task force in advance.**

- ◆ Assemble a team with technical, advocacy and communications expertise. Draw from internal resources as well as professionals and leaders in the community. Designate a single spokesperson to make announcements, respond to questions and conduct interviews. Doing so is critical to ensuring the accuracy and consistency of public information.

#### **3. Create a contact list.**

- ◆ Having names, phone numbers, fax numbers and email addresses at your fingertips is vital, especially when a quick response is necessary. Create a contact list and update it regularly. It should include task force members as well as fact-finding and communications contacts, including:

- |                                 |                                    |
|---------------------------------|------------------------------------|
| ◆ School Superintendent         | ◆ State Department of Education    |
| ◆ School Board Members          | ◆ State Department of Health       |
| ◆ Civic Leaders                 | ◆ State Drinking Water Program     |
| ◆ Local Public Health Officials | ◆ EPA Regional Office              |
| ◆ Head of Building              | ◆ Utility/Water Supplier           |
| Maintenance/Custodial           | ◆ Media (Newspaper, TV, Radio, Web |
| Services                        | and Newswire Outlets)              |

### Step 4: Issue and Crisis Management Guidelines

#### 4. Define what constitutes an issue or crisis.

- 💧 **Issue:** A situation or specific event that has the potential to undermine credibility and positive public perception.
- 💧 **Crisis:** An event or series of events that directly damage your facility's reputation by demonstrating or implying a failure to ensure public safety.

#### 5. Identify your target audiences for ongoing issue/crisis communication.

##### 💧 **Internal:**

- 💧 Teachers
- 💧 Administrative Staff
- 💧 Custodial Staff

##### 💧 **External:**

- 💧 Students and Parents
- 💧 Media
- 💧 Local Health Community
- 💧 Local Drinking Water Community
- 💧 Local Environmental Community
- 💧 Local Lead Poisoning Prevention Program

#### 6. Launch an ongoing campaign of education and awareness, capitalizing on a variety of communication vehicles.

- 💧 Press Releases (media)
- 💧 Follow-up Letters and Flyers (parents)
- 💧 Paycheck Stuffers (school or child care employees)
- 💧 Newsletter (parents and staff)
- 💧 Newsletter Articles (for advocacy groups, parent-teacher organizations, chambers of commerce, service clubs and other stakeholders)
- 💧 Postcard-style Information Updates (parents)
- 💧 Workshop/Open House (parents and community at large)
- 💧 Presentations (before a variety of local civic and community groups)

### Page Three · Issue and Crisis Management Guidelines

**7. Prepare a fact sheet so that your task force spokesperson has accurate, up-to-date information about the status of your plumbing system and water source. Information should include answers to the following questions:**

- 💧 When was the building constructed?
- 💧 Since then, have any new buildings or additions been constructed?
- 💧 If built after 1986, were lead-free plumbing and solder used in accordance with the requirements of the 1986 Safe Drinking Water Act Amendments?
- 💧 What are the potable water pipes made of in your facility? Does your facility contain components that may leach lead?
- 💧 Has your school or child care center checked the brands and models of water coolers to see if they are on EPA's list of banned coolers with lead-lined tanks?
- 💧 Has water quality testing been conducted at your facility? Were samples tested for lead, and if so, what concentrations of lead were found?
- 💧 Is water tested regularly for lead at your facility?
- 💧 Who supplies your facility's drinking water?
- 💧 According to information provided by your public water supplier:
  - 💧 Is the water system in compliance with federal and state standards for lead?
  - 💧 What is the latest 90th percentile lead level for the public water system?
  - 💧 Does the utility collect samples from your facility?
  - 💧 Is a corrosion control chemical being used? Does the system have results to show the effectiveness of the control measures? If so, what are they?
  - 💧 Does the water distribution system have any lead piping? If so, does the public water system plan to remove these sources of lead?
  - 💧 Will your water system provide assistance to support your efforts to minimize exposure to lead in your facility's drinking water?

### Page Four - Issue and Crisis Management Guidelines

- ◆ If potential problem areas have been identified and a sampling plan is being developed, provide answers to the following questions:
  - ◆ Who is heading up your sampling effort?
  - ◆ Who will collect and analyze samples and maintain records?
  - ◆ Where will the samples be collected?
  
- ◆ If sampling has just been completed, have answers to these questions:
  - ◆ What were the results?
  - ◆ Did lead levels exceed the EPA level of concern of 20 ppb? If so, at which drinking water outlets?
  - ◆ What is being done on an immediate, short-term and permanent basis to address any identified problems?
  - ◆ How are sampling results being made available to the public, including parents, teachers and other staff members, the media, and relevant parent, teacher, student and employee organizations?
  - ◆ If concerned, how and where can individuals be tested for blood lead levels?

**GCHD and MDHHS Partner to Issue Guidance to Flint Parents, Providers**

FLINT, Mich. – In a joint effort to continue informing the community about lead exposure, the Genesee County Health Department (GCHD) and Michigan Department of Health and Human Services (MDHHS) today issued letters to parents and the provider community in Flint to assist in providing guidance to support families.

In response to the elevated blood lead levels found in some Flint children, GCHD and MDHHS have worked together closely to develop guidance for families and providers.

**GCHD QUOTE**

Parents are being provided information regarding lead testing, how to reduce lead exposure for your family, where lead comes from, and community and state resources for more information. Children can be exposed to lead from drinking water in lead pipes, old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass and jewelry making, and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.

“As we continue to find ways to inform and guide the Flint community towards reducing lead exposures, we are appreciate of the collaboration with Genesee County Health Department,” said Dr. Eden Wells, Chief Medical Executive with MDHHS. “Parents and providers can take a number of steps to help reduce exposure, identify signs of lead poisoning, and begin follow up care as needed. Working together we can all help to protect the health of families in Flint.”

Primary care providers can assist in helping to ensure that children and families exposed to lead receive the care and resources they need to manage the potential health impacts of lead poisoning. MDHHS and GCHD worked with Dr. Mona Hanna-Attisha of the Hurley Medical Center to develop testing protocols and guidance regarding identification of lead poisoning, management of elevated blood lead levels, follow-up care, and community and state resources.

GCHD and MDHHS issued the following recommendations for parents:

- Families who live in the City of Flint and are on the Flint water system or who attend school, childcare, or spend time with a caregiver in the City of Flint, are encouraged to get their children tested for lead poisoning at their doctor’s office or GCHD.
- Families can get their water tested for lead for free. Call 810-787-6537 for details about how.
- Families are encouraged to use a water filter in their home, and free filters are still available. Call 2-1-1 for information about where to pick up a free filter.
- Use filtered tap water for drinking (including making coffee, drink mixes, juice, baby formula), and cooking (even if you boil the water, the lead will stay in the water and food). Always use cold water when cooking.
- You can use unfiltered tap water for washing your hands, and washing dishes. If using unfiltered water, run the water for at least five minutes before you use it.
- Safe cleaning can also reduce the risk of lead exposure in the home. You can use unfiltered tap water for the following wiping down countertops, mopping floors, and washing clothes.

- Keep children away from lead paint and dust; use wet paper towels to clean up lead dust around windows, play areas and floors; and wash hands and toys often, using soap and water
- Lastly, always wash fruits with filtered water. Some foods help keep lead from being stored in the child's body, such as Calcium rich foods, Iron rich foods, and foods with Vitamin C.

GCHD and MDHHS will continue to provide more information to the community regarding reducing lead exposure and protecting the health of Flint residents. For more information, visit [www.michigan.gov/lead](http://www.michigan.gov/lead).

**This Document is a Non-Responsive Attachment.**

October 25, 2015

Dear Parent,

To help make sure the children of Flint are safe from lead exposure, the Genesee County Health Department and the Michigan Department of Health and Human Services want to help you understand:

- Where does lead come from?
- What can I do to protect my family?
- Should I get my child tested for lead?
- Where can I find more information about lead?

### **Where does lead come from?**

Lead is a serious health hazard, especially for small children who become lead poisoned when they eat, drink or breathe lead. Elevated levels of lead have been found in the drinking water from lead pipes in the City of Flint. Kids can also be exposed to lead from old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass, jewelry making and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.

### **Should my child get a blood lead test?**

Children who live in the City of Flint, live in a home using City of Flint water, or who attend school, childcare or often spend time with a caregiver in the City of Flint should be tested for lead poisoning. *This should be done as soon as possible.*

### **Where should I go to get a blood lead test for my child?**

The best place to get your child's blood lead test is your doctor's office. Your pediatrician will follow up with you on lab tests and provide you with information on what to do next. You can also have a lead test at the Genesee County Health Department. If you need transportation, contact 2-1-1 for help.

### **Understanding your child's lead test result.**

**A lead level below 5** means there is little or no lead in your child's blood. Use the tips below to help keep your child safe. Your doctor may suggest retesting your child within the next 12 months to make sure the level does not go up.

**A lead level of 5-14** means that your child has had some exposure to lead. Work with your doctor and local health department for further guidance on how to limit your lead exposure. Your doctor may retest your child in 1-3 months to make sure the level does not go up.

Children with very high levels of lead (**over 40**) may require treatment at the hospital.

### **What Can I Do to Keep My Family Safe?**

The following steps should be taken right away to help protect you and your child.

#### **Protecting your family from lead in the water:**

- Get your water tested for lead. It's free. Call (810) 787-6537 to learn more.
- Use a water filter in your home. Call 2-1-1 for information on free water filters.
- If you do not have a water filter, use bottled water for drinking and mixing formula.
- Use filtered tap water for drinking (including making coffee, drink mixes, juice, baby formula), and cooking (even if you boil the water, the lead will stay in the water and food). Always use cold water when cooking.
- You can use unfiltered tap water for washing your hands, and washing dishes. If using unfiltered water, run the water for at least five minutes before you use it.

#### **Safe cleaning:**

Safe Cleaning is important. Keeping your home clean and safe from lead hazards will help to protect your family.

- You can use unfiltered tap water for the following wiping down countertops, mopping floors, and washing clothes.
- Keep children away from lead paint and dust.
- Use wet paper towels to clean up lead dust. Be sure to clean around windows, play areas and floors.
- Wash hands and toys often, using soap and water.

#### **Good nutrition:**

Some foods will help keep lead from being stored in a child's body. These are foods with a lot of calcium, iron and vitamin C. These foods include:

**Calcium Rich Foods**

**Iron Rich Foods**

**Foods with Vitamin C**

- |           |                                    |                 |
|-----------|------------------------------------|-----------------|
| ➤ Milk    | ➤ Beans                            | ➤ Oranges       |
| ➤ Cheese  | ➤ Lean meats like fish and chicken | ➤ Orange juice  |
| ➤ Yogurt  | ➤ Whole grain cereals              | ➤ Grapefruits   |
| ➤ Tofu    | ➤ Peanut butter                    | ➤ Tomatoes      |
| ➤ Spinach |                                    | ➤ Green peppers |

Always wash your fruits with filtered water. If you are concerned about your child's diet, talk with your pediatrician who may also recommend a daily multivitamin.

WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the **Genesee County WIC office at (810) 237-4537** to learn more. SNAP also offers a Double Bucks program to purchase even more healthy food for no additional costs.

LoRocco Edits, Travis Edits, Attisha Edits, Peeler, Minicuci Edits

Cross checked with parent letter

Dear Provider:

As you may be aware from recent news reports, elevated levels of lead have been found in lead pipes within the City of Flint's water system.

To help protect the children of Flint from the current lead in water exposure, the Genesee County Health Department and Michigan Department of Health and Human Services are contacting you to assist you in providing guidance to support your families.

Children can be exposed to lead from drinking water in lead pipes, old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass and jewelry making, and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.

As a primary care provider, you play a critical role in helping to ensure that children and families exposed to lead receive the care and reassurances they need to manage the potential health impacts of lead poisoning.

**Identification.** Children suffering from lead poisoning often fail to present outward symptoms. However, early clinical symptoms can include anemia, anorexia, abdominal pain and constipation. Lead is a neuro-toxin, and exposure can result in violent and aggressive behaviors, lead to learning disorders, may cause Attention Deficit Hyperactivity Disorder (ADHD) and has been known to reduce IQ by as many as 5-8 points with levels as low as 10 ug/dL. Lead is metabolized through the gastrointestinal system similar to iron and calcium, with uptake rates depending on the size and weight of the child. The blood half-life of lead is short (approximately 1 month) but the bone half-life can extend into decades.

Due to multiple risk factors facing many residents in the City of Flint (including aging housing conditions and water quality), we recommend that all children under age 6 living in the City of Flint or living in homes that use Flint water, attending school or childcare in Flint, or who spend time with a caregiver in the City of Flint, receive a blood lead test. Blood lead testing should be done through a child's primary care doctor to ensure adequate short-term and long-term follow-up. ***Families should be encouraged to have their children tested immediately either at their doctor's office or the Genesee County Health Department.***

**Management of Blood Lead Levels.** The following guidance is provided for management of childhood blood lead levels:

- **BLL < 5 ug/dL**
  - A lead level of less than 5 mcg/dL is not typically cause for concern.
  - Provide education and anticipatory guidance to ensure that lead levels do not rise.
  - Consider retesting in 12 months based on risk factors or concerns.
- **BLL >5 ug/dL**
  - **Children with capillary results of 5 ug/dL and higher must have a confirmatory venous blood draw.**
  - Families should receive anticipatory guidance, nutrition counseling, instruction on safe cleaning techniques and appropriate follow-up care from their primary care provider.

Cross checked with parent letter

- In-home services including case management and environmental investigations are available for all children with lead levels greater than 5 ug/dL. Refer patients to the Genesee County Health Department for this service.
- Children with confirmed venous testing results greater than 5ug/dL within the past 18 months must be retested based on Medicaid policy and AAP guidelines. (See attached "Provider Quick Reference"). If a child has not been retested within these timeframes, retesting is recommended as soon as possible.
- **BLL > 44 ug/dL.**
  - **Children with capillary results of 5 ug/dL and higher must have a confirmatory venous blood draw.**
  - Lead levels over 44 ug/dL may require hospitalization. Consult with an expert at the Children's Hospital of Michigan in Detroit for additional guidance.
  - Families should receive anticipatory guidance, nutrition counseling, instruction on safe cleaning techniques and appropriate follow-up care from their primary care provider.
  - In-home services including case management and environmental investigations are available for all children with lead levels greater than 5 ug/dL. Refer patients to the Genesee County Health Department for this service.
  - Children with confirmed venous testing results greater than 5ug/dL within the past 18 months must be retested based on Medicaid policy and AAP guidelines. (See attached "Provider Quick Reference"). If a child has not been retested within these timeframes, retesting is recommended as soon as possible.

**Reminder: All children covered by Medicaid must be tested at age 1 and 2.**

**Follow-up Care.** As providers, there are steps you can take to help support your families:

1. Continue to inform and educate families regarding lead risks and preventative steps that they can take to minimize their risks.
2. Encourage your families to use filtered water for drinking, mixing formula and washing dishes. Families can contact 2-1-1 for information on free water filters.
3. Healthy nutrition is critical for lead-exposed children. Make sure your patients are consuming balanced diets high in iron, calcium and Vitamin C. If you have concerns about their nutrition, consider recommending a multivitamin with iron. WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the Genesee County WIC office at (810) 237-4537 to learn more. In addition, SNAP offers a Double Bucks program that can provide healthy foods for less.
4. Breastfeeding is highly protective and encouraged. However, if the mother's blood lead level rises above 40ug/dL or her level is greater than 20 ug/dL and the baby has a level above 5 ug/dL breastfeeding is not recommended.
5. Because lead is a neuro-toxin, children with lead poisoning need longitudinal follow-up and may require developmental and behavioral health intervention services. Continue monitoring your patients' development at every visit.
6. Consider additional wrap-around and support services that will benefit your patients such as early childhood home visiting programs, early head start and head start. Call 2-1-1 for more information.

PROVIDER DRAFT LETTER V.5

**Local Resources.** Several local resources are available to you and your patients:

- Blood Testing. Patients are encouraged to contact their primary care provider for testing. The Genesee County Health Department also administers lead tests. Patients in need of transportation should contact 2-1-1 for assistance.
- Water Testing. Water testing is free through the City of Flint Water Testing Plant. Patients can call 810-787-6537 to learn more.
- WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the Genesee County WIC office at (810) 237-4537 to learn more.
- Child Development. If you have concerns about a child's growth, development or learning contact 2-1-1 for a Home Visiting Program in your area.

**Press Release:**

“As we continue to find ways to inform and guide the Flint community towards reducing lead exposures, we are appreciate appreciative of the collaboration with Genesee County Health Department,” said Dr. Eden Wells, Chief Medical Executive with MDHHS. “Parents and providers can take a number of steps to help reduce exposure, identify signs of lead poisoning, and begin follow up care as needed. Working together we can all help to protect the health of families in Flint.”

**Parent Letter:** The word doctor is used throughout the document- we should stay consistent.

**Where should I go to get a blood lead test for my child?**

The best place to get your child’s blood lead test is your doctor’s office. Your doctor ~~pediatrician~~ will follow up with you on lab tests and provide you with information on what to do next. You can also have a lead test at the Genesee County Health Department. If you need transportation, contact 2-1-1 for help.

So- stating that flushing the tap for 5 minutes first time of day or other? We are using the FAQ- we would have to look back at that.

Sent from my iPhone

On Oct 26, 2015, at 8:15 AM, Brickey, Tamara <[tbrickey@gchd.us](mailto:tbrickey@gchd.us)> wrote:

Hi all,

I was out of the office Friday so I apologize for the late response. With the parent letter, do you mean to communicate that you need to run the tap for five minutes before you can wash your hands? "You can use unfiltered tap water for washing your hands, and washing dishes. If using unfiltered water, run the water for at least five minutes before you use it." This sentence reads as though every time you wash your hands with unfiltered water, you need to run the tap for five minutes. I know most families will have concern with that.

Thanks,

**FOR IMMEDIATE RELEASE – DRAFT**

**GCHD CONTACT:**

**MDHHS CONTACT:** Jennifer Eisner, (517) 241-2112, [EisnerJ@michigan.gov](mailto:EisnerJ@michigan.gov)

**GCHD and MDHHS Partner to Issue Guidance to Flint Parents, Providers**

FLINT, Mich. – In a joint effort to continue informing the community about lead exposure, the Genesee County Health Department (GCHD) and Michigan Department of Health and Human Services (MDHHS) today issued letters to parents and the provider community in Flint to assist in providing guidance to support families.

In response to the elevated blood lead levels found in some Flint children, GCHD and MDHHS have worked together closely to develop guidance for families and providers.

**GCHD QUOTE**

Parents are being provided information regarding lead testing, how to reduce lead exposure for your family, where lead comes from, and community and state resources for more information. Children can be exposed to lead from drinking water in lead pipes, old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass and jewelry making, and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.

“As we continue to find ways to inform and guide the Flint community towards reducing lead exposures, we are appreciate of the collaboration with Genesee County Health Department,” said Dr. Eden Wells, Chief Medical Executive with MDHHS. “Parents and providers can take a number of steps to help reduce exposure, identify signs of lead poisoning, and begin follow up care as needed. Working together we can all help to protect the health of families in Flint.”

Primary care providers can assist in helping to ensure that children and families exposed to lead receive the care and resources they need to manage the potential health impacts of lead poisoning. MDHHS and GCHD worked with Dr. Mona Hanna-Attisha of the Hurley Medical Center to develop testing protocols and guidance regarding identification of lead poisoning, management of elevated blood lead levels, follow-up care, and community and state resources.

GCHD and MDHHS issued the following recommendations for parents:

- Families who live in the City of Flint and are on the Flint water system or who attend school, childcare, or spend time with a caregiver in the City of Flint, are encouraged to get their children tested for lead poisoning at their doctor’s office or GCHD.
- Families can get their water tested for lead for free. Call 810-787-6537 for details about how.
- Families are encouraged to use a water filter in their home, and free filters are still available. Call 2-1-1 for information about where to pick up a free filter.
- Use filtered tap water for drinking (including making coffee, drink mixes, juice, baby formula), and cooking (even if you boil the water, the lead will stay in the water and food). Always use cold water when cooking.
- You can use unfiltered tap water for washing your hands, and washing dishes. If using unfiltered water, run the water for at least five minutes before you use it.
- Safe cleaning can also reduce the risk of lead exposure in the home. You can use unfiltered tap water for the following wiping down countertops, mopping floors, and washing clothes.

- Keep children away from lead paint and dust; use wet paper towels to clean up lead dust around windows, play areas and floors; and wash hands and toys often, using soap and water
- Lastly, always wash fruits with filtered water. Some foods help keep lead from being stored in the child's body, such as Calcium rich foods, Iron rich foods, and foods with Vitamin C.

GCHD and MDHHS will continue to provide more information to the community regarding reducing lead exposure and protecting the health of Flint residents. For more information, visit [www.michigan.gov/lead](http://www.michigan.gov/lead).

**This Document is a Non-Responsive Attachment.**

October 25, 2015

Dear Parent,

To help make sure the children of Flint are safe from lead exposure, the Genesee County Health Department and the Michigan Department of Health and Human Services want to help you understand:

- Where does lead come from?
- What can I do to protect my family?
- Should I get my child tested for lead?
- Where can I find more information about lead?

### **Where does lead come from?**

Lead is a serious health hazard, especially for small children who become lead poisoned when they eat, drink or breathe lead. Elevated levels of lead have been found in the drinking water from lead pipes in the City of Flint. Kids can also be exposed to lead from old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass, jewelry making and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.

### **Should my child get a blood lead test?**

Children who live in the City of Flint, live in a home using City of Flint water, or who attend school, childcare or often spend time with a caregiver in the City of Flint should be tested for lead poisoning. *This should be done as soon as possible.*

### **Where should I go to get a blood lead test for my child?**

The best place to get your child's blood lead test is your doctor's office. Your pediatrician will follow up with you on lab tests and provide you with information on what to do next. You can also have a lead test at the Genesee County Health Department. If you need transportation, contact 2-1-1 for help.

### **Understanding your child's lead test result.**

**A lead level below 5** means there is little or no lead in your child's blood. Use the tips below to help keep your child safe. Your doctor may suggest retesting your child within the next 12 months to make sure the level does not go up.

**A lead level of 5-14** means that your child has had some exposure to lead. Work with your doctor and local health department for further guidance on how to limit your lead exposure. Your doctor may retest your child in 1-3 months to make sure the level does not go up.

Children with very high levels of lead (**over 40**) may require treatment at the hospital.

### **What Can I Do to Keep My Family Safe?**

The following steps should be taken right away to help protect you and your child.

#### **Protecting your family from lead in the water:**

- Get your water tested for lead. It's free. Call (810) 787-6537 to learn more.
- Use a water filter in your home. Call 2-1-1 for information on free water filters.
- If you do not have a water filter, use bottled water for drinking and mixing formula.
- Use filtered tap water for drinking (including making coffee, drink mixes, juice, baby formula), and cooking (even if you boil the water, the lead will stay in the water and food). Always use cold water when cooking.
- You can use unfiltered tap water for washing your hands, and washing dishes. If using unfiltered water, run the water for at least five minutes before you use it.

#### **Safe cleaning:**

Safe Cleaning is important. Keeping your home clean and safe from lead hazards will help to protect your family.

- You can use unfiltered tap water for the following wiping down countertops, mopping floors, and washing clothes.
- Keep children away from lead paint and dust.
- Use wet paper towels to clean up lead dust. Be sure to clean around windows, play areas and floors.
- Wash hands and toys often, using soap and water.

#### **Good nutrition:**

Some foods will help keep lead from being stored in a child's body. These are foods with a lot of calcium, iron and vitamin C. These foods include:

**Calcium Rich Foods**

**Iron Rich Foods**

**Foods with Vitamin C**

- |           |                                    |                 |
|-----------|------------------------------------|-----------------|
| ➤ Milk    | ➤ Beans                            | ➤ Oranges       |
| ➤ Cheese  | ➤ Lean meats like fish and chicken | ➤ Orange juice  |
| ➤ Yogurt  | ➤ Whole grain cereals              | ➤ Grapefruits   |
| ➤ Tofu    | ➤ Peanut butter                    | ➤ Tomatoes      |
| ➤ Spinach |                                    | ➤ Green peppers |

Always wash your fruits with filtered water. If you are concerned about your child's diet, talk with your pediatrician who may also recommend a daily multivitamin.

WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the **Genesee County WIC office at (810) 237-4537** to learn more. SNAP also offers a Double Bucks program to purchase even more healthy food for no additional costs.

Dear Provider:

As you may be aware from recent news reports, elevated levels of lead have been found in lead pipes within the City of Flint's water system.

To help protect the children of Flint from the current lead in water exposure, the Genesee County Health Department and Michigan Department of Health and Human Services are contacting you to assist you in providing guidance to support your families.

Children can be exposed to lead from drinking water in lead pipes, old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass and jewelry making, and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.

As a primary care provider, you play a critical role in helping to ensure that children and families exposed to lead receive the care and reassurances they need to manage the potential health impacts of lead poisoning.

**Identification.** Children suffering from lead poisoning often fail to present outward symptoms. However, early clinical symptoms can include anemia, anorexia, abdominal pain and constipation. Lead is a neuro-toxin, and exposure can result in violent and aggressive behaviors, lead to learning disorders, may cause Attention Deficit Hyperactivity Disorder (ADHD) and has been known to reduce IQ by as many as 5-8 points with levels as low as 10 ug/dL. Lead is metabolized through the gastrointestinal system similar to iron and calcium, with uptake rates depending on the size and weight of the child. The blood half-life of lead is short (approximately 1 month) but the bone half-life can extend into decades.

Due to multiple risk factors facing many residents in the City of Flint (including aging housing conditions and water quality), we recommend that all children under age 6 living in the City of Flint or living in homes that use Flint water, attending school or childcare in Flint, or who spend time with a caregiver in the City of Flint, receive a blood lead test. Blood lead testing should be done through a child's primary care doctor to ensure adequate short-term and long-term follow-up. ***Families should be encouraged to have their children tested immediately either at their doctor's office or the Genesee County Health Department.***

**Management of Blood Lead Levels.** The following guidance is provided for management of childhood blood lead levels:

- **BLL < 5 ug/dL**
  - A lead level of less than 5 mcg/dL is not typically cause for concern.
  - Provide education and anticipatory guidance to ensure that lead levels do not rise.
  - Consider retesting in 12 months based on risk factors or concerns.
- **BLL >5 ug/dL**
  - **Children with capillary results of 5 ug/dL and higher must have a confirmatory venous blood draw.**
  - Families should receive anticipatory guidance, nutrition counseling, instruction on safe cleaning techniques and appropriate follow-up care from their primary care provider.

October 25, 2015

LoRocco Edits, Travis Edits, Attisha Edits, Peeler, Minicuci Edits

Cross checked with parent letter

- In-home services including case management and environmental investigations are available for all children with lead levels greater than 5 ug/dL. Refer patients to the Genesee County Health Department for this service.
- Children with confirmed venous testing results greater than 5ug/dL within the past 18 months must be retested based on Medicaid policy and AAP guidelines. (See attached "Provider Quick Reference"). If a child has not been retested within these timeframes, retesting is recommended as soon as possible.
- **BLL > 44 ug/dL.**
  - **Children with capillary results of 5 ug/dL and higher must have a confirmatory venous blood draw.**
  - Lead levels over 44 ug/dL may require hospitalization. Consult with an expert at the Children's Hospital of Michigan in Detroit for additional guidance.
  - Families should receive anticipatory guidance, nutrition counseling, instruction on safe cleaning techniques and appropriate follow-up care from their primary care provider.
  - In-home services including case management and environmental investigations are available for all children with lead levels greater than 5 ug/dL. Refer patients to the Genesee County Health Department for this service.
  - Children with confirmed venous testing results greater than 5ug/dL within the past 18 months must be retested based on Medicaid policy and AAP guidelines. (See attached "Provider Quick Reference"). If a child has not been retested within these timeframes, retesting is recommended as soon as possible.

**Reminder: All children covered by Medicaid must be tested at age 1 and 2.**

**Follow-up Care.** As providers, there are steps you can take to help support your families:

1. Continue to inform and educate families regarding lead risks and preventative steps that they can take to minimize their risks.
2. Encourage your families to use filtered water for drinking, mixing formula and washing dishes. Families can contact 2-1-1 for information on free water filters.
3. Healthy nutrition is critical for lead-exposed children. Make sure your patients are consuming balanced diets high in iron, calcium and Vitamin C. If you have concerns about their nutrition, consider recommending a multivitamin with iron. WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the Genesee County WIC office at (810) 237-4537 to learn more. In addition, SNAP offers a Double Bucks program that can provide healthy foods for less.
4. Breastfeeding is highly protective and encouraged. However, if the mother's blood lead level rises above 40ug/dL or her level is greater than 20 ug/dL and the baby has a level above 5 ug/dL breastfeeding is not recommended.
5. Because lead is a neuro-toxin, children with lead poisoning need longitudinal follow-up and may require developmental and behavioral health intervention services. Continue monitoring your patients' development at every visit.
6. Consider additional wrap-around and support services that will benefit your patients such as early childhood home visiting programs, early head start and head start. Call 2-1-1 for more information.

**Local Resources.** Several local resources are available to you and your patients:

- Blood Testing. Patients are encouraged to contact their primary care provider for testing. The Genesee County Health Department also administers lead tests. Patients in need of transportation should contact 2-1-1 for assistance.
- Water Testing. Water testing is free through the City of Flint Water Testing Plant. Patients can call 810-787-6537 to learn more.
- WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the Genesee County WIC office at (810) 237-4537 to learn more.
- Child Development. If you have concerns about a child's growth, development or learning contact 2-1-1 for a Home Visiting Program in your area.

Hi all,

I was out of the office Friday so I apologize for the late response. With the parent letter, do you mean to communicate that you need to run the tap for five minutes before you can wash your hands? "You can use unfiltered tap water for washing your hands, and washing dishes. If using unfiltered water, run the water for at least five minutes before you use it." This sentence reads as though every time you wash your hands with unfiltered water, you need to run the tap for five minutes. I know most families will have concern with that.

Thanks,

**Tamara Brickey, MS, CHES**

Documents look great, a couple edits---

Press Release:

“As we continue to find ways to inform and guide the Flint community towards reducing lead exposures, we are appreciate appreciative of the collaboration with Genesee County Health Department,” said Dr. Eden Wells, Chief Medical Executive with MDHHS. “Parents and providers can take a number of steps to help reduce exposure, identify signs of lead poisoning, and begin follow up care as needed. Working together we can all help to protect the health of families in Flint.”

Parent Letter: The word doctor is used throughout the document- we should stay consistent.

**Where should I go to get a blood lead test for my child?**

The best place to get your child’s blood lead test is your doctor’s office. Your doctor ~~pediatrician~~ will follow up with you on lab tests and provide you with information on what to do next. You can also have a lead test at the Genesee County Health Department. If you need transportation, contact 2-1-1 for help.

**GCHD and MDHHS Partner to Issue Guidance to Flint Parents, Providers**

FLINT, Mich. – In a joint effort to continue informing the community about lead exposure, the Genesee County Health Department (GCHD) and Michigan Department of Health and Human Services (MDHHS) today issued letters to parents and the provider community in Flint to assist in providing guidance to support families.

In response to the elevated blood lead levels found in some Flint children, GCHD and MDHHS have worked together closely to develop guidance for families and providers.

**GCHD QUOTE**

Parents are being provided information regarding lead testing, how to reduce lead exposure for your family, where lead comes from, and community and state resources for more information. Children can be exposed to lead from drinking water in lead pipes, old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass and jewelry making, and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.

“As we continue to find ways to inform and guide the Flint community towards reducing lead exposures, we are appreciate of the collaboration with Genesee County Health Department,” said Dr. Eden Wells, Chief Medical Executive with MDHHS. “Parents and providers can take a number of steps to help reduce exposure, identify signs of lead poisoning, and begin follow up care as needed. Working together we can all help to protect the health of families in Flint.”

Primary care providers can assist in helping to ensure that children and families exposed to lead receive the care and resources they need to manage the potential health impacts of lead poisoning. MDHHS and GCHD worked with Dr. Mona Hanna-Attisha of the Hurley Medical Center to develop testing protocols and guidance regarding identification of lead poisoning, management of elevated blood lead levels, follow-up care, and community and state resources.

GCHD and MDHHS issued the following recommendations for parents:

- Families who live in the City of Flint and are on the Flint water system or who attend school, childcare, or spend time with a caregiver in the City of Flint, are encouraged to get their children tested for lead poisoning at their doctor’s office or GCHD.
- Families can get their water tested for lead for free. Call 810-787-6537 for details about how.
- Families are encouraged to use a water filter in their home, and free filters are still available. Call 2-1-1 for information about where to pick up a free filter.
- Use filtered tap water for drinking (including making coffee, drink mixes, juice, baby formula), and cooking (even if you boil the water, the lead will stay in the water and food). Always use cold water when cooking.
- You can use unfiltered tap water for washing your hands, and washing dishes. If using unfiltered water, run the water for at least five minutes before you use it.
- Safe cleaning can also reduce the risk of lead exposure in the home. You can use unfiltered tap water for the following wiping down countertops, mopping floors, and washing clothes.

- Keep children away from lead paint and dust; use wet paper towels to clean up lead dust around windows, play areas and floors; and wash hands and toys often, using soap and water
- Lastly, always wash fruits with filtered water. Some foods help keep lead from being stored in the child's body, such as Calcium rich foods, Iron rich foods, and foods with Vitamin C.

GCHD and MDHHS will continue to provide more information to the community regarding reducing lead exposure and protecting the health of Flint residents. For more information, visit [www.michigan.gov/lead](http://www.michigan.gov/lead).

October 26, 2015

Dear Parent,

To help make sure the children of Flint are safe from lead exposure, the Genesee County Health Department and the Michigan Department of Health and Human Services want to help you understand:

- Where does lead come from?
- What can I do to protect my family?
- Should I get my child tested for lead?
- Where can I find more information about lead?

### **Where does lead come from?**

Lead is a serious health hazard, especially for small children who become lead poisoned when they eat, drink or breathe lead. Elevated levels of lead have been found in the drinking water from lead pipes in the City of Flint. Kids can also be exposed to lead from old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass, jewelry making and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.

### **Should my child get a blood lead test?**

Children who live in the City of Flint, live in a home using City of Flint water, or who attend school, childcare or often spend time with a caregiver in the City of Flint should be tested for lead poisoning. *This should be done as soon as possible.*

### **Where should I go to get a blood lead test for my child?**

The best place to get your child's blood lead test is your doctor's office. Your pediatrician will follow up with you on lab tests and provide you with information on what to do next. You can also have a lead test at the Genesee County Health Department. If you need transportation, contact 2-1-1 for help.

### **Understanding your child's lead test result.**

**A lead level below 5** means there is little or no lead in your child's blood. Use the tips below to help keep your child safe. Your doctor may suggest retesting your child within the next 12 months to make sure the level does not go up.

**A lead level of 5-14** means that your child has had some exposure to lead. Work with your doctor and local health department for further guidance on how to limit your lead exposure. Your doctor may retest your child in 1-3 months to make sure the level does not go up.

Children with very high levels of lead (**over 40**) may require treatment at the hospital.

### **What Can I Do to Keep My Family Safe?**

The following steps should be taken right away to help protect you and your child.

#### **Protecting your family from lead in the water:**

- Get your water tested for lead. It's free. Call (810) 787-6537 to learn more.
- Use a water filter in your home. Call 2-1-1 for information on free water filters.
- If you do not have a water filter, use bottled water for drinking and mixing formula.
- Use filtered tap water for drinking (including making coffee, drink mixes, juice, baby formula), and cooking (even if you boil the water, the lead will stay in the water and food). Always use cold water when cooking.
- You can use unfiltered tap water for washing your hands, and washing dishes.
- If unfiltered water must be used for consumption, run the tap for five minutes prior to consuming. Do this first thing in morning or if the faucet has not been used in more than 8 hours.

#### **Safe cleaning:**

Safe Cleaning is important. Keeping your home clean and safe from lead hazards will help to protect your family.

- You can use unfiltered tap water for the following wiping down countertops, mopping floors, and washing clothes.
- Keep children away from lead paint and dust.
- Use wet paper towels to clean up lead dust. Be sure to clean around windows, play areas and floors.
- Wash hands and toys often, using soap and water.

#### **Good nutrition:**

Some foods will help keep lead from being stored in a child's body. These are foods with a lot of calcium, iron and vitamin C. These foods include:

**Calcium Rich Foods**

**Iron Rich Foods**

**Foods with Vitamin C**

- |           |                                    |                 |
|-----------|------------------------------------|-----------------|
| ➤ Milk    | ➤ Beans                            | ➤ Oranges       |
| ➤ Cheese  | ➤ Lean meats like fish and chicken | ➤ Orange juice  |
| ➤ Yogurt  | ➤ Whole grain cereals              | ➤ Grapefruits   |
| ➤ Tofu    | ➤ Peanut butter                    | ➤ Tomatoes      |
| ➤ Spinach |                                    | ➤ Green peppers |

Always wash your fruits with filtered water. If you are concerned about your child's diet, talk with your pediatrician who may also recommend a daily multivitamin.

WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the **Genesee County WIC office at (810) 237-4537** to learn more. SNAP also offers a Double Bucks program to purchase even more healthy food for no additional costs.

PROVIDER DRAFT LETTER V.6

October 26, 2015

LoRocco Edits, Travis Edits, Attisha Edits, Peeler, Minicuci Edits

Cross checked with parent letter

October 26, 2015

Dear Provider:

As you may be aware from recent news reports, elevated levels of lead have been found in lead pipes within the City of Flint's water system.

To help protect the children of Flint from the current lead in water exposure, the Genesee County Health Department and Michigan Department of Health and Human Services are contacting you to assist you in providing guidance to support your families.

Children can be exposed to lead from drinking water in lead pipes, old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass and jewelry making, and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.

As a primary care provider, you play a critical role in helping to ensure that children and families exposed to lead receive the care and reassurances they need to manage the potential health impacts of lead poisoning.

**Identification.** Children suffering from lead poisoning often fail to present outward symptoms. However, early clinical symptoms can include anemia, anorexia, abdominal pain and constipation. Lead is a neuro-toxin, and exposure can result in violent and aggressive behaviors, lead to learning disorders, may cause Attention Deficit Hyperactivity Disorder (ADHD) and has been known to reduce IQ by as many as 5-8 points with levels as low as 10 ug/dL. Lead is metabolized through the gastrointestinal system similar to iron and calcium, with uptake rates depending on the size and weight of the child. The blood half-life of lead is short (approximately 1 month) but the bone half-life can extend into decades.

Due to multiple risk factors facing many residents in the City of Flint (including aging housing conditions and water quality), we recommend that all children under age 6 living in the City of Flint or living in homes that use Flint water, attending school or childcare in Flint, or who spend time with a caregiver in the City of Flint, receive a blood lead test. Blood lead testing should be done through a child's primary care doctor to ensure adequate short-term and long-term follow-up. ***Families should be encouraged to have their children tested immediately either at their doctor's office or the Genesee County Health Department.***

**Management of Blood Lead Levels.** The following guidance is provided for management of childhood blood lead levels:

- **BLL < 5 ug/dL**
  - A lead level of less than 5 mcg/dL is not typically cause for concern.
  - Provide education and anticipatory guidance to ensure that lead levels do not rise.
  - Consider retesting in 12 months based on risk factors or concerns.
- **BLL >5 ug/dL**
  - **Children with capillary results of 5 ug/dL and higher must have a confirmatory venous blood draw.**

PROVIDER DRAFT LETTER V.6

October 26, 2015

LoRocco Edits, Travis Edits, Attisha Edits, Peeler, Minicuci Edits

Cross checked with parent letter

- Families should receive anticipatory guidance, nutrition counseling, instruction on safe cleaning techniques and appropriate follow-up care from their primary care provider.
- In-home services including case management and environmental investigations are available for all children with lead levels greater than 5 ug/dL. Refer patients to the Genesee County Health Department for this service.
- Children with confirmed venous testing results greater than 5ug/dL within the past 18 months must be retested based on Medicaid policy and AAP guidelines. (See attached "Provider Quick Reference). If a child has not been retested within these timeframes, retesting is recommended as soon as possible.
- **BLL > 44 ug/dL.**
  - **Children with capillary results of 5 ug/dL and higher must have a confirmatory venous blood draw.**
  - Lead levels over 44 ug/dL may require hospitalization. Consult with an expert at the Children's Hospital of Michigan in Detroit for additional guidance.
  - Families should receive anticipatory guidance, nutrition counseling, instruction on safe cleaning techniques and appropriate follow-up care from their primary care provider.
  - In-home services including case management and environmental investigations are available for all children with lead levels greater than 5 ug/dL. Refer patients to the Genesee County Health Department for this service.
  - Children with confirmed venous testing results greater than 5ug/dL within the past 18 months must be retested based on Medicaid policy and AAP guidelines. (See attached "Provider Quick Reference). If a child has not been retested within these timeframes, retesting is recommended as soon as possible.

**Reminder: All children covered by Medicaid must be tested at age 1 and 2.**

**Follow-up Care.** As providers, there are steps you can take to help support your families:

1. Continue to inform and educate families regarding lead risks and preventative steps that they can take to minimize their risks.
2. Encourage your families to use filtered water for drinking, mixing formula and washing dishes. Families can contact 2-1-1 for information on free water filters.
3. Healthy nutrition is critical for lead-exposed children. Make sure your patients are consuming balanced diets high in iron, calcium and Vitamin C. If you have concerns about their nutrition, consider recommending a multivitamin with iron. WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the Genesee County WIC office at (810) 237-4537 to learn more. In addition, SNAP offers a Double Bucks program that can provide healthy foods for less.
4. Breastfeeding is highly protective and encouraged. However, if the mother's blood lead level rises above 40ug/dL or her level is greater than 20 ug/dL and the baby has a level above 5 ug/dL breastfeeding is not recommended.
5. Because lead is a neuro-toxin, children with lead poisoning need longitudinal follow-up and may require developmental and behavioral health intervention services. Continue monitoring your patients' development at every visit.

Cross checked with parent letter

6. Consider additional wrap-around and support services that will benefit your patients such as early childhood home visiting programs, early head start and head start. Call 2-1-1 for more information.

**Local Resources.** Several local resources are available to you and your patients:

- Blood Testing. Patients are encouraged to contact their primary care provider for testing. The Genesee County Health Department also administers lead tests. Patients in need of transportation should contact 2-1-1 for assistance.
- Water Testing. Water testing is free through the City of Flint Water Testing Plant. Patients can call 810-787-6537 to learn more.
- WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the Genesee County WIC office at (810) 237-4537 to learn more.
- Child Development. If you have concerns about a child's growth, development or learning contact 2-1-1 for a Home Visiting Program in your area.

**Subject:** RE: BLLs Latest

I can do it. How about this?

- 1) Total number of children tested since 9/28/15 press conference.
- 2) Total number of children with capillary EBLLs since 4/1/14 water change, still needing confirmation.
- 3) Total number of confirmed EBLL cases since 4/1/14.
- 4) Total number of children with capillary EBLLs since 9/28/15, needing confirmation.
- 5) Total number of confirmed EBLL cases since 9/28/15.

We've been having the same conversation here -- yes, we can do that, happy to do that. Bob was starting to work on a format this morning. If you have specific information you would want in a weekly report, let us know, as that will help us to pull what you really need. I know Epi was also talking about a weekly analysis of sorts, which I think would go more in-depth than the counts and such we can give you as a starting point.

**To:** Peeler, Nancy (DHHS); Scott, Robert L. (DHHS); Wells, Eden (DHHS)  
**Subject:** BLLs Latest

Hi Nancy and Bob,

Out of curiosity, could we begin looking at pulling some data about recent Flint BLL data? I think all results have to be reported to us within 5 days of the test result, correct?

If so, is there any chance we can begin taking a look at what that data is telling us? Not wanting to do anything with it yet, but just trying to think a little more proactively.

Thanks,

**Angela Minicuci**

**Sent:** Monday, October 26, 2015 4:09 PM  
**To:** Valacak, Mark; LaRocco, Toni; [GJOHNSON@gchd.us](mailto:GJOHNSON@gchd.us); [hmcshane@gchd.us](mailto:hmcshane@gchd.us)  
**Cc:** Minicuci, Angela (DHHS)  
**Subject:** Fwd: FINAL Documents

Hi folks,

Here are the final materials from NDHHS on joint letterheads. The press release needs a comment from you all. Please send your final draft of press release to Angela and I.

Based on when letters are printed and ready to be sent and ready to send out- this will be ready- will discuss timing for now.

Eden

**Subject:** FINAL Documents

Hi Eden,

Attached are the final letters and press release. I also have all of the attachments that need to be sent with these letters but I'm not including them here.

Can you please share these with everyone? We will print the letters and their attachments, and GCHD can send the release when the letters are going to be sent.

Thank you,

**Angela Minicuci**

October 26, 2015

Dear Parent,

To help make sure the children of Flint are safe from lead exposure, the Genesee County Health Department and the Michigan Department of Health and Human Services are providing answers to the following questions:

- Where does lead come from?
- What can I do to protect my family?
- Should I get my child tested for lead?
- Where can I find more information about lead?

### **Where does lead come from?**

Elevated levels of lead have been found in the drinking water from lead pipes in the City of Flint. Kids can also be exposed to lead from old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass, jewelry making and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found. Lead is a serious health hazard, especially for small children who become lead poisoned when they eat, drink or breathe lead.

**Should my child get a blood lead test?** Children who live in the City of Flint, live in a home using City of Flint water, or who attend school, childcare or often spend time with a caregiver in the City of Flint should be tested for lead poisoning.

*This should be done as soon as possible.*

### **Where should I go to get a blood lead test for my child?**

The best place to get your child's blood lead test is your doctor's office. Tests are covered by most health plans. Your doctor will follow up with you on lab tests and provide you with information on what to do next. Your child can also get a free lead test at the Genesee County Health Department. If you need transportation, contact 2-1-1 for help.

### **Understanding your child's lead test result.**

**A lead level below 5** means there is a little lead in your child's blood. Use the tips below to help keep your child safe. Your doctor may suggest retesting your child within the next 12 months to make sure the level does not go up.

**A lead level of 5-44** means that your child has had some exposure to lead. Work with your doctor and local health department for further guidance on how to limit your lead exposure. Your doctor may retest your child in 1-3 months to make sure the level does not go up.

Children with very high levels of lead (**over 44**) may require treatment at the hospital.

### **What Can I Do to Keep My Family Safe?**

The following steps should be taken right away to help protect you and your child.

### **Protecting your family from lead in the water:**

- Get your water tested for lead. It's free. Call (810) 787-6537 to learn more.
- Use a water filter in your home. Call 2-1-1 for information on free NSF Certified water filters.
- Run only cold water through the filter.
- If you do not have a water filter, use bottled water for drinking and mixing formula.
- Use filtered or bottled water for drinking (including making coffee, drink mixes, juice, baby formula), and cooking (even if you boil the water, the lead will stay in the water and food).
- You can use unfiltered tap water for washing your hands and washing dishes.
- If you have to use unfiltered water for drinking or cooking, run the tap for five minutes before using the water.

### **Safe cleaning:**

Safe cleaning is important. Keeping your home clean and safe from lead hazards will help to protect your family.

- Buildings built before 1978 could have lead paint in them. Use wet paper towels to clean up paint chips and dust in these older buildings. Be sure to clean around windows, play areas, and floors.
- Wash hands and toys often with soap and water.
- You can use unfiltered tap water to wipe down countertops, mop floors, and wash clothes.

### **Good nutrition:**

Some foods will help keep lead from being stored in a child's body. These are foods with a lot of calcium, iron and vitamin C. These foods include:

<b>Calcium Rich Foods</b>	<b>Iron Rich Foods</b>	<b>Foods with Vitamin C</b>
➤ Milk	➤ Beans	➤ Oranges
➤ Cheese	➤ Lean meats like fish and chicken	➤ Orange juice
➤ Yogurt	➤ Whole grain cereals	➤ Grapefruits
➤ Tofu	➤ Peanut butter	➤ Tomatoes
➤ Spinach		➤ Green peppers

Always wash your fruits with filtered water. If you are concerned about your child's diet, talk with your doctor who may also recommend a daily multivitamin.

WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the **Genesee County WIC office at (810) 237-4537** to learn more. SNAP also offers a Double Bucks program to purchase even more healthy food for no additional costs.

**Where can I get more information on lead?**

**FOR IMMEDIATE RELEASE – DRAFT**

**GCHD CONTACT:**

**MDHHS CONTACT:** Jennifer Eisner, (517) 241-2112, [EisnerJ@michigan.gov](mailto:EisnerJ@michigan.gov)

## **GCHD and MDHHS Partner to Issue Guidance to Flint Parents, Providers**

FLINT, Mich. – In a joint effort to continue informing the community about lead exposure, the Genesee County Health Department (GCHD) and Michigan Department of Health and Human Services (MDHHS) today issued letters to parents and the provider community in Flint to assist in providing guidance to support families.

In response to the elevated blood lead levels found in some Flint children, GCHD and MDHHS have worked together closely to develop guidance for families and providers.

### **GCHD QUOTE**

Parents are being provided information regarding lead testing, how to reduce lead exposure for your family, where lead comes from, and community and state resources for more information. Children can be exposed to lead from drinking water in lead pipes, old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass and jewelry making, and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.

“As we continue to find ways to inform and guide the Flint community towards reducing lead exposures, we are appreciative of the collaboration with Genesee County Health Department,” said Dr. Eden Wells, Chief Medical Executive with MDHHS. “Parents and providers can take a number of steps to help reduce exposure, identify signs of lead poisoning, and begin follow up care as needed. Working together we can all help to protect the health of families in Flint.”

Primary care providers can assist in helping to ensure that children and families exposed to lead receive the care and resources they need to manage the potential health impacts of lead poisoning. MDHHS and GCHD worked with Dr. Mona Hanna-Attisha of the Hurley Medical Center to develop testing protocols and guidance regarding identification of lead poisoning, management of elevated blood lead levels, follow-up care, and community and state resources.

GCHD and MDHHS issued the following recommendations for parents:

- Families who live in the City of Flint and are on the Flint water system or who attend school, childcare, or spend time with a caregiver in the City of Flint, are encouraged to get their children tested for lead poisoning at their doctor’s office or GCHD.
- Families can get their water tested for lead for free. Call 810-787-6537 for details about how.

- Families are encouraged to use an NSF Certified water filter in their home, and free filters are still available. Call 2-1-1 for information about where to pick up a free filter.
- Run only cold water through the filter.
- Use filtered or bottled water for drinking (including making coffee, drink mixes, juice, baby formula), and cooking (even if you boil the water, the lead will stay in the water and food).
- You can use unfiltered tap water for washing your hands, and washing dishes. If you must use unfiltered water for drinking or cooking, run the tap for five minutes before using the water.
- Safe cleaning can also reduce the risk of lead exposure in the home. You can use unfiltered tap water to wipe down countertops, mop floors, and wash clothes.
- Keep children away from lead paint and dust; use wet paper towels to clean up lead dust around windows, play areas and floors; and wash hands and toys often, using soap and water
- Lastly, always wash fruits with filtered water. Some foods help keep lead from being stored in the child's body, such as Calcium rich foods, Iron rich foods, and foods with Vitamin C.

GCHD and MDHHS will continue to provide more information to the community regarding reducing lead exposure and protecting the health of Flint residents. For more information, visit [www.michigan.gov/lead](http://www.michigan.gov/lead).

PROVIDER DRAFT LETTER V.6

October 26, 2015

LoRocco Edits, Travis Edits, Attisha Edits, Peeler, Minicuci Edits

Cross checked with parent letter

October 26, 2015

Dear Provider:

As you may be aware from recent news reports, elevated levels of lead have been found in lead pipes within the City of Flint's water system.

To help protect the children of Flint from the current lead in water exposure, the Genesee County Health Department and Michigan Department of Health and Human Services are contacting you to assist you in providing guidance to support your families.

Children can be exposed to lead from drinking water in lead pipes, old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass and jewelry making, and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.

As a primary care provider, you play a critical role in helping to ensure that children and families exposed to lead receive the care and reassurances they need to manage the potential health impacts of lead poisoning.

**Identification.** Children suffering from lead poisoning often fail to present outward symptoms. However, early clinical symptoms can include anemia, anorexia, abdominal pain and constipation. Lead is a neuro-toxin, and exposure can result in violent and aggressive behaviors, lead to learning disorders, may cause Attention Deficit Hyperactivity Disorder (ADHD) and has been known to reduce IQ by as many as 5-8 points with levels as low as 10 ug/dL. Lead is metabolized through the gastrointestinal system similar to iron and calcium, with uptake rates depending on the size and weight of the child. The blood half-life of lead is short (approximately 1 month) but the bone half-life can extend into decades.

Due to multiple risk factors facing many residents in the City of Flint (including aging housing conditions and water quality), we recommend that all children under age 6 living in the City of Flint or living in homes that use Flint water, attending school or childcare in Flint, or who spend time with a caregiver in the City of Flint, receive a blood lead test. Blood lead testing should be done through a child's primary care doctor to ensure adequate short-term and long-term follow-up. ***Families should be encouraged to have their children tested immediately either at their doctor's office or the Genesee County Health Department.***

**Management of Blood Lead Levels.** The following guidance is provided for management of childhood blood lead levels:

- **BLL < 5 ug/dL**
  - A lead level of less than 5 mcg/dL is not typically cause for concern.
  - Provide education and anticipatory guidance to ensure that lead levels do not rise.
  - Consider retesting in 12 months based on risk factors or concerns.
- **BLL >5 ug/dL**
  - **Children with capillary results of 5 ug/dL and higher must have a confirmatory venous blood draw.**

PROVIDER DRAFT LETTER V.6

October 26, 2015

LoRocco Edits, Travis Edits, Attisha Edits, Peeler, Minicuci Edits

Cross checked with parent letter

- Families should receive anticipatory guidance, nutrition counseling, instruction on safe cleaning techniques and appropriate follow-up care from their primary care provider.
- In-home services including case management and environmental investigations are available for all children with lead levels greater than 5 ug/dL. Refer patients to the Genesee County Health Department for this service.
- Children with confirmed venous testing results greater than 5ug/dL within the past 18 months must be retested based on Medicaid policy and AAP guidelines. (See attached "Provider Quick Reference). If a child has not been retested within these timeframes, retesting is recommended as soon as possible.
- **BLL > 44 ug/dL.**
  - **Children with capillary results of 5 ug/dL and higher must have a confirmatory venous blood draw.**
  - Lead levels over 44 ug/dL may require hospitalization. Consult with an expert at the Children's Hospital of Michigan in Detroit for additional guidance.
  - Families should receive anticipatory guidance, nutrition counseling, instruction on safe cleaning techniques and appropriate follow-up care from their primary care provider.
  - In-home services including case management and environmental investigations are available for all children with lead levels greater than 5 ug/dL. Refer patients to the Genesee County Health Department for this service.
  - Children with confirmed venous testing results greater than 5ug/dL within the past 18 months must be retested based on Medicaid policy and AAP guidelines. (See attached "Provider Quick Reference). If a child has not been retested within these timeframes, retesting is recommended as soon as possible.

**Reminder: All children covered by Medicaid must be tested at age 1 and 2.**

**Follow-up Care.** As providers, there are steps you can take to help support your families:

1. Continue to inform and educate families regarding lead risks and preventative steps that they can take to minimize their risks.
2. Encourage your families to use filtered water for drinking, mixing formula and washing dishes. Families can contact 2-1-1 for information on free water filters.
3. Healthy nutrition is critical for lead-exposed children. Make sure your patients are consuming balanced diets high in iron, calcium and Vitamin C. If you have concerns about their nutrition, consider recommending a multivitamin with iron. WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the Genesee County WIC office at (810) 237-4537 to learn more. In addition, SNAP offers a Double Bucks program that can provide healthy foods for less.
4. Breastfeeding is highly protective and encouraged. However, if the mother's blood lead level rises above 40ug/dL or her level is greater than 20 ug/dL and the baby has a level above 5 ug/dL breastfeeding is not recommended.
5. Because lead is a neuro-toxin, children with lead poisoning need longitudinal follow-up and may require developmental and behavioral health intervention services. Continue monitoring your patients' development at every visit.

6. Consider additional wrap-around and support services that will benefit your patients such as early childhood home visiting programs, early head start and head start. Call 2-1-1 for more information.

**Local Resources.** Several local resources are available to you and your patients:

- Blood Testing. Patients are encouraged to contact their primary care provider for testing. The Genesee County Health Department also administers lead tests. Patients in need of transportation should contact 2-1-1 for assistance.
- Water Testing. Water testing is free through the City of Flint Water Testing Plant. Patients can call 810-787-6537 to learn more.
- WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the Genesee County WIC office at (810) 237-4537 to learn more.
- Child Development. If you have concerns about a child's growth, development or learning contact 2-1-1 for a Home Visiting Program in your area.

**Subject:** FW: DRAFT DELIBERATIVE; NOT SUBJECT TO FOIA - drinking water lead level

Eden and Sue,

The attached provides the draft justification for screening values to be used to evaluate the results of drinking water sampling efforts at Flint schools.

HHS Division of Environmental Health toxicologist Jennifer Gray conducted the modeling and drafted the justification along with Toxicology and Response Section manager Kory Groetsch. They met with a select group of DEQ toxicologists, incorporated their comments and suggestions, the obtained concurrence on the appropriateness of the inputs and the conclusions. DEQ Dept. Dir. Jim Sygo has also been provided with the draft justification.

A risk management decision is now needed and there are 2 options: a single screening value of 2 ppb that would apply to all schools including daycares and elementary schools OR a 2-tier approach in which 2 ppb would apply only where children 0-12 months are present, but a higher concentration of 11 ppb would be used to protect children up to 7 years.

Linda

Justification of the drinking water “no corrective action” lead level for use in the Flint school and daycare  
drinking water sample decision tree

The Michigan Department of Health and Human Services (MDHHS) requested that the Toxic Steering Group (TSG) provide endorsement of a health-based drinking water lead level that would require “no corrective action” to put back into service drinking water faucets and fountains used by Flint school and daycare children. Selection of the “corrective actions” was not included in the charge question and is not discussed in this document. A TSG subcommittee was convened to examine this issue. Subcommittee members included Deb Mackenzie-Taylor (Michigan Department of Environmental Quality [MDEQ]), Robert Sills (MDEQ), Eric Wildfang (MDEQ), Jennifer Gray (MDHHS), Christine Flaga (MDEQ), and Kory Groetsch (MDHHS).

Neither the Centers for Disease Control and Prevention’s Agency for Toxic Substances and Disease Registry (ATSDR) nor the U.S. Environmental Protection Agency (EPA) have derived toxicity endpoints (e.g. reference dose, minimal risk level) for lead to be used in risk assessments. Both agencies have stated that no blood lead level has been found to be safe and precautionary actions to reduce exposure to lead, such as running tapwater briefly before use, should always be followed. Due to the pharmacokinetic data and initial acceptable blood lead, the EPA developed a biokinetic model for evaluating lead exposure from multiple media. Lead levels in air, soil, house dust, diet, drinking water, and maternal blood are used to estimate geometric mean blood lead levels for a population of children and the probability that a child would be above a specified blood lead level<sup>1</sup>. The model results are compared to an EPA population health protection goal for young children exposed to lead at residential properties of 5% or lower risk of a child having a blood level greater than the CDC reference value of 5 micrograms lead per deciliter blood ( $\mu\text{g}/\text{dL}$ )<sup>2</sup>. The model, however, does not include inputs to account for direct paint chip ingestion and assumes that children are not exposed to elevated lead in soil and house dust from lead based paint.

Use of the EPA’s Integrated Exposure Uptake Biokinetic (IEUBK) Model

The EPA’s Integrated Exposure Uptake Biokinetic (IEUBK) Model for Lead in Children version 1.1 Build 11 was used to evaluate exposure to children one year old or younger and children seven years old or younger. Default values were retained unless otherwise noted below. See Table 2-1 in the “User’s Guide for the Integrated Exposure Uptake Biokinetic Model for Lead in Children (IEUBK) Windows<sup>®</sup>” for the listing of all the default values<sup>3</sup>. Values selected that are more appropriate for a Michigan urban area, Flint, are described briefly below.

---

<sup>1</sup> The modeling output includes the percent of children in a population that are above a specified blood lead level, but that value can also be viewed as the probability (risk) that a certain child would be above the specified blood lead level.

<sup>2</sup> As stated on the EPA’s Lead at Superfund Sites: Frequent Questions from Risk Assessors on the Integrated Exposure Uptake Biokinetic (IEUBK) Model webpage, found at <http://www2.epa.gov/superfund/lead-superfund-sites-frequent-questions-risk-assessors-integrated-exposure-uptake#mean>.

<sup>3</sup> The model itself and documentation, including the user’s guide for the model can be found at <http://www2.epa.gov/superfund/lead-superfund-sites-software-and-users-manuals>.

### *Air data*

MDEQ performs monitoring for lead in ambient air (as measured in Total Suspended Particulates; lead [TSP]) at a number of fixed stations in Michigan. Some of these monitoring stations (e.g., in Belding, Port Huron, and Vassar) were established to intentionally capture the influence of specific nearby industrial emissions, while others were established to provide data reflecting the general ambient air lead levels in urban areas. The TSG Subcommittee reviewed the ambient air monitoring data, focusing on urban ambient air lead data that would be representative of contemporary Flint conditions. The most recent MDEQ annual air monitoring report is for 2014<sup>4</sup>. The summary statistics provided in the MDEQ annual air quality reports include 3-month average (mean) levels, the highest value (24-hour sample), and the 2<sup>nd</sup> highest value (24-hour sample). The National Ambient Air Quality Standard (NAAQS) for lead (0.15 micrograms per cubic meter [ $\mu\text{g}/\text{m}^3$ ]) has a 3-month averaging time.

Ambient air lead was monitored by MDEQ in Flint (Whaley Park; 3610 Iowa Ave.) until early 2007. The 2005 calendar quarter arithmetic mean values were 0.008, 0.010, 0.011, and 0.012  $\mu\text{g}/\text{m}^3$ . The 2006 calendar quarter arithmetic mean values were 0.005, 0.007, 0.012, and 0.006  $\mu\text{g}/\text{m}^3$ . Although Flint data more recent than 2007 are not available, MDEQ staff considered other urban lead monitoring sites to be fairly representative of Flint conditions. Grand Rapids, Allen Park, and Dearborn each had a highest rolling 3-month arithmetic mean lead (TSP) level of 0.01  $\mu\text{g}/\text{m}^3$  in 2013; for 2014, these values were 0.01  $\mu\text{g}/\text{m}^3$  for Grand Rapids and Allen Park and 0.02  $\mu\text{g}/\text{m}^3$  for Dearborn. These data indicate that the IEUBK model default value of 0.1  $\mu\text{g}/\text{m}^3$  is not the most appropriate air lead level for Flint, and support a representative value of 0.01  $\mu\text{g}/\text{m}^3$  for the air data model input assumption. While a slightly higher air lead level was obtained for Dearborn, the small difference between 0.01 and 0.02  $\mu\text{g}/\text{m}^3$ , would not impact model outputs.

### *Water consumption*

The default drinking water intakes are age-dependent and based on national averages<sup>5</sup>. These were updated to match the mean drinking water intakes (direct and indirect) in Table 3-1 from the U.S. EPA Exposure Factors Handbook: 2011 Edition<sup>6</sup>.

- 0-1 years old - 0.32 liter/day (L/d) (age-adjusted from the values in Table 3-1)
- 1-2 years old - 0.271 L/d
- 2-3 years old - 0.317 L/d
- 3-4 years old - 0.327 L/d (3 to 6 years old in Table 3-1)
- 4-5 years old - 0.327 L/d (3 to 6 years old in Table 3-1)

---

<sup>4</sup> The MDEQ 2014 Annual Air Quality Report can be found at [http://www.michigan.gov/documents/deq/deq-aqd-amu-2014\\_Annual\\_Air\\_Quality\\_Report\\_492732\\_7.pdf?20151014123800](http://www.michigan.gov/documents/deq/deq-aqd-amu-2014_Annual_Air_Quality_Report_492732_7.pdf?20151014123800).

<sup>5</sup> Per the “User’s Guide for the Integrated Exposure Uptake Biokinetic Model for Lead in Children (IEUBK) Windows®”, “The default consumption rates are age-dependent and based on national averages. These consumption rates should be changed only when valid site-specific monitoring data is available.”

<sup>6</sup> The U.S. EPA Exposure Factors Handbook: 2011 Edition can be found at <file:///C:/Users/gravi/Downloads/EFH-COMPLETE.PDF>.

- 5-6 years old - 0.327 L/d (3 to 6 years old in Table 3-1)
- 6-7 years old - 0.414 L/d (6 to 11 years old in Table 3-1)

*Drinking water data for alternate drinking water sources*

The alternate drinking water sources used for these modeling runs are listed below with a brief description.

- “Percent of Total Consumed as First Draw” – This value applies to household tap water. This was set to 0% as Genesee County issued an Public Health Emergency Advisory<sup>7</sup> recommending that no one drink the City of Flint water until it has been tested or unless it is being filtered through a filter meeting the National Sanitation Foundation (NSF)/American National Standards Institute (ANSI) standard 53.
- “Concentration of Lead in First Draw (µg/L)” – With the “Percent of Total Consumed as First Draw” set to 0%, this value will not alter the model run output so the default of 4 micrograms per liter (µg/L or parts per billion [ppb]) was retained.
- “Concentration of Lead in Flushed (µg/L)” – This value applies to household tap water. This was set to 1 µg/L (ppb) as filters meeting NSF/ANSI standard 53 are recommended for use in all households. The filters distributed remove greater than 99% of the lead and would result in filtered water containing lead levels of approximately 1 µg/L (ppb) or less.
- “Percentage of Total Consumed from Fountains” – This was set to 50%, as children in school and daycare settings spend around eight hours or more in those locations. Eight hours could be expected to be approximately half of their waking hours in a day. This value also assumes daily intake of drinking water from a school or daycare source. There could be variation in the amount of time children would actually be drinking water from these locations based on involvement in before- or after-school or daycare programs, activities, or events.
- “Concentration of Lead in Fountain Water (µg/L)” – Modeling runs were carried out for every 1 µg/L (ppb) step between zero and 15 µg/L, and also 30 and 100 µg/L (ppb). Modeling runs for the zero to 15 µg/L (ppb) steps were carried out to perform a sensitivity analysis to evaluate how a one µg/L (ppb) change in lead water concentrations alters the outputs of the model. The 30 and 100 µg/L (ppb) levels were included as preliminary representatives of high-end lead levels obtained from school drinking water fountains.

*Site-specific soil data*

Soil lead levels on residential properties vary greatly<sup>8</sup>. The primary influence is from pre-1978 use of lead paint on the outside of buildings<sup>9,10,11</sup>. Lead-paint was banned in 1978. In addition, the age of

<sup>9</sup> Francek, M. A. (1992). "Soil lead levels in a small town environment: a case study from Mt Pleasant, Michigan." *Environ Pollut* **76**(3): 251-257.

housing<sup>8,9</sup>, paint condition, and distance from the building can greatly impact the concentration of lead in soil. The soil lead concentrations near the foundation of houses with lead paint are frequently over 1,000 ppm<sup>9,11,12,13</sup>. Historic vehicle emissions from leaded gasoline are another source of residential soil lead, so distance from road and traffic volume at the time leaded gasoline was in use are also influential factors on residential soil concentrations<sup>10,11,13</sup>. Other potential influences are fill material (e.g., foundry sand, smelter slag), and/or local industrial emission sources. The highest soil lead concentrations are typically found in urban areas with high population density.

Soil lead data for residential soils in Flint are not currently available. Flint park data and other relevant residential soil lead studies were reviewed to evaluate appropriate surrogate concentrations for this assessment.

The MDEQ<sup>14</sup> reported soil lead concentrations from urban parks including Flint. This data set included 12 sample locations from 10 Flint parks. Surface soil samples were collected at 0-2 inches and subsurface samples were collected at 4-6 inches. This dataset may not adequately represent residential soil samples with a lead paint contribution from buildings. Other studies have shown that open spaces may have much lower soil lead concentrations than areas near residential buildings that were built prior to 1978<sup>11,15</sup>. The geometric mean and geometric mean plus two standard deviation surface soil concentrations (see below) from this Flint park dataset were used for this assessment. The geometric mean plus two standard deviation surface soil concentration represents an upper percentile value that may partially account for the higher soil lead levels expected around buildings with lead paint.

Another data source is from soil samples collected from the Rouge River watershed between 1992 and 2002<sup>16</sup>. This dataset was compiled from MDEQ files and Clayton Group Services files for the Rouge River watershed area in southeast Michigan. Although some data is from Part 201 sites of environmental contamination, most of the samples were collected as a result of other regulatory or real estate due diligence requirements. Sites with known industrial metal sources or that had near surface soil with unknown fill material were excluded from the dataset. The dataset included 28 residential sites that had

535 surface soil samples with data reported for lead. Sample depth was 0 – 0.5 meters. The geometric mean value for residential surface soils reported from this study (see below) was used for this assessment.

The current Part 201 residential direct contact risk-based soil level was also used for this assessment for comparison. This value was generated from the IEUBK model using an acceptable blood lead concentration of 10 µg/dL, a drinking water concentration of 4 µg/L (ppb) and an Michigan-specific average air concentration of 0.04 µg/m<sup>3</sup> were used in the model at the time of criteria development.

Soil levels examined in the model runs were:

- 47.5 parts per million (ppm) – based on the geometric mean of 0-2 inch soil concentrations in Flint urban parks.
- 155 ppm – based on the geometric mean + two standard deviations of 0-2 inch soil concentrations in Flint urban parks.
- 160 ppm – based on the geometric mean for residential surface soil (0-0.5 meter) from Rouge River water shed<sup>17</sup>.
- 400 ppm - the MDEQ Residential Direct Contact Risk-Based Screening Level for soil.

Both the residential soil geometric mean from the Rouge River watershed and the upper percentile from the Flint park data appear to represent the best surrogates for residential soil concentrations in Flint for this assessment. Although not from Flint, the Rouge River watershed residential soil data appears to be a fairly robust data set for urban residential soils in Michigan. The Flint park data upper percentile (geometric mean plus two standard deviations is approximately equivalent to the 97.5 percentile) may better account for potential building paint contributions to soil concentrations for urban residential soils than the geometric mean concentration of this dataset. The Flint park upper percentile (155 ppm) reported as two significant digits is equivalent to the Rouge River watershed residential soil lead geometric mean (160 ppm). The soil lead concentration of 160 ppm was selected for use in the calculation of the TSG Subcommittee's recommended health-based drinking water lead levels.

#### *Maternal data*

Maternal blood lead levels were changed to 0.8 µg/dL to match the NHANES (2011-2012) geometric mean lead level for women<sup>18</sup>.

#### *Blood level of concern (cutoff) for risk estimation*

A cutoff value of 5 µg/dL was selected as the current Centers for Disease Control and Prevention blood reference level to identify children with blood lead levels that require follow-up actions. It is based on the blood lead level for the 97.5<sup>th</sup> percentile for the U.S. population of children, ages one to five<sup>19</sup>.

---

<sup>17</sup> The value is from Table 5 in Murray, K. S., D. T. Rogers, et al. (2004). "Heavy metals in an urban watershed in southeastern Michigan." *J Environ Qual* **33**(1): 163-172.

<sup>18</sup> The Fourth National Report on Human Exposure to Environmental Chemicals, dated February 2015, can be found at [http://www.cdc.gov/biomonitoring/pdf/FourthReport\\_UpdatedTables\\_Feb2015.pdf](http://www.cdc.gov/biomonitoring/pdf/FourthReport_UpdatedTables_Feb2015.pdf).

Outputs of the modeling runs and recommendation of drinking water lead levels for use during the evaluation of Flint school and daycare drinking water samples

The soil lead level of 160 ppm was selected as being the best surrogate for soil lead levels in the city of Flint. In the event that site-specific soil data is collected, the drinking water lead levels may need to be reevaluated. The entire set of modeling runs and graphs can be found in Attachment 1.

The recommended drinking water lead levels resulted in a 5% risk or lower that a child had a blood lead level above 5 µg/dL. The 5% is an EPA health protection goal for young children exposed to lead at residential properties.

*Evaluating school and daycare drinking water samples together*

The recommended lead screening level for use while evaluating both school and daycare drinking water samples is 2 µg/L (ppb). This lead level in drinking water samples results in no more than a 5% risk that children age 7 or younger would have blood lead levels above 5 µg/dL.

Age range	Blood lead geometric mean (in micrograms per deciliter [µg/dL])	Risk that a child could have a blood lead level above 5 µg/dL
0-1 year olds	2.308	5.004%
0-7 year olds	2.056	2.934%

*Assumptions integral to the use of the health-based school and daycare drinking water lead level*

This calculation includes two assumptions. One is that people have lead levels in home drinking water of no more than 1 µg/L (ppb) or are using filters to reduce lead levels to 1 µg/L (ppb) or below. The second is that children do not live in homes with highly elevated levels of lead in home dust or soil. The modeled lead dust levels do not account for lead coming from pre-1978 paint. Eighty-two percent of city of Flint houses were built before 1970<sup>20</sup>. Soil highly impacted with lead paint may have lead levels higher than the 160 ppm used in this calculation. If children are not drinking filtered water at home, are ingesting lead paint chips, or have elevated levels of lead in home dust or soil, a lead level lower than the one recommended above may need to be selected for the evaluation of school and daycare drinking water samples.

*Evaluating school and daycare drinking water samples separately*

The recommended lead screening level for use while evaluating daycare drinking water samples is

---

<sup>19</sup> The blood reference level and additional information can be found at [http://www.cdc.gov/nceh/lead/ACCLPP/blood\\_lead\\_levels.htm](http://www.cdc.gov/nceh/lead/ACCLPP/blood_lead_levels.htm).

<sup>20</sup> As determined by the U.S. Census and can be found at [http://factfinder.census.gov/faces/tableservices/jsf/pages/productview.xhtml?pid=ACS\\_14\\_1YR\\_S1101&prodType=table](http://factfinder.census.gov/faces/tableservices/jsf/pages/productview.xhtml?pid=ACS_14_1YR_S1101&prodType=table).

2 µg/L (ppb). This lead level in drinking water samples results in no more than a 5% risk that children age 1 or younger would have blood lead levels above 5 µg/dL.

Age range	Blood lead geometric mean (in micrograms per deciliter [µg/dL])	Risk that a child could have a blood lead level above 5 µg/dL
0-1 year olds	2.308	5.004%
0-7 year olds	2.056	2.934%

*Assumptions integral to the use of the health-based daycare drinking water lead level*

This calculation includes two assumptions. One is that people have lead levels in home drinking water of no more than 1 µg/L (ppb) or are using filters to reduce lead levels to 1 µg/L (ppb) or below. The second is that children do not live in homes with highly elevated levels of lead in home dust or soil. The modeled lead dust levels do not account for lead coming from pre-1978 paint. Eighty-two percent of city of Flint houses were built before 1970. Soil highly impacted with lead paint may have lead levels higher than the 160 ppm used in this calculation. If children are not drinking filtered water at home, are ingesting lead paint chips, or have elevated levels of lead in home dust or soil, a lead level lower than the one recommended above may need to be selected for the evaluation of school and daycare drinking water samples.

The recommended lead screening level for use while evaluating K-12 school drinking water samples is 11 µg/L (ppb). This lead level in drinking water samples results in no more than a 5% risk that children age 7 or younger would have blood lead levels above 5 µg/dL. However, when evaluating a population of children age 1 or younger, their risk of having a blood lead level above 5 µg/dL was 8.335%. The 11 µg/L (ppb) screening level is not adequately protective for children under the age of 1.

Age range	Blood lead geometric mean (in micrograms per deciliter [µg/dL])	Risk that a child could have a blood lead level above 5 µg/dL
0-1 year olds	2.61	8.335%
0-7 year olds	2.299	4.917%

*Assumptions integral to the use of the health-based school drinking water lead level*

This calculation includes two assumptions. One is that people have lead levels in home drinking water of no more than 1 µg/L (ppb) or are using filters to reduce lead levels to 1 µg/L (ppb) or below. The second is that children do not live in homes with highly elevated levels of lead in home dust or soil. The modeled lead dust levels do not account for lead coming from pre-1978 paint. Eighty-two percent of city of Flint houses were built before 1970. Soil highly impacted with lead paint may have lead levels higher than the 160 ppm used in this calculation. If children are not drinking filtered water at home, are ingesting lead paint chips, or have elevated levels of lead in home dust or soil, a lead level lower than the one recommended above may need to be selected for the evaluation of school and daycare drinking water samples.

**Sent:** Monday, October 26, 2015 4:09 PM  
**To:** Valacak, Mark; LaRocco, Toni; [GJOHNSON@gchd.us](mailto:GJOHNSON@gchd.us); [hmcshane@gchd.us](mailto:hmcshane@gchd.us)  
**Cc:** Minicuci, Angela (DHHS)  
**Subject:** Fwd: FINAL Documents

Hi folks,

Here are the final materials from NDHHS on joint letterheads. The press release needs a comment from you all. Please send your final draft of press release to Angela and I.

Based on when letters are printed and ready to be sent and ready to send out- this will be ready- will discuss timing for now.

Eden

**Subject:** FINAL Documents

Hi Eden,

Attached are the final letters and press release. I also have all of the attachments that need to be sent with these letters but I'm not including them here.

Can you please share these with everyone? We will print the letters and their attachments, and GCHD can send the release when the letters are going to be sent.

Thank you,

**Angela Minicuci**

October 27, 2015

Dear Parent,

To help make sure the children of Flint are safe from lead exposure, the Genesee County Health Department and the Michigan Department of Health and Human Services are providing answers to the following questions:

- Where does lead come from?
- What can I do to protect my family?
- Should I get my child tested for lead?
- Where can I find more information about lead?

### **Where does lead come from?**

Elevated levels of lead have been found in the drinking water from lead pipes in the City of Flint. Kids can also be exposed to lead from old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass, jewelry making and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found. Lead is a serious health hazard, especially for small children who become lead poisoned when they eat, drink or breathe lead.

**Should my child get a blood lead test?** Children who live in the City of Flint, live in a home using City of Flint water, or who attend school, childcare or often spend time with a caregiver in the City of Flint should be tested for lead poisoning.

*This should be done as soon as possible.*

### **Where should I go to get a blood lead test for my child?**

The best place to get your child's blood lead test is your doctor's office. Tests are covered by most health plans. Your doctor will follow up with you on lab tests and provide you with information on what to do next. Your child can also get a free lead test at the Genesee County Health Department. If you need transportation, contact 2-1-1 for help.

### **Understanding your child's lead test result.**

**A lead level below 5** means there is a little lead in your child's blood. Use the tips below to help keep your child safe. Your doctor may suggest retesting your child within the next 12 months to make sure the level does not go up.

**A lead level of 5-44** means that your child has had some exposure to lead. Work with your doctor and local health department for further guidance on how to limit your lead exposure. Your doctor may retest your child in 1-3 months to make sure the level does not go up.

Children with very high levels of lead (**over 44**) may require treatment at the hospital.

### **What Can I Do to Keep My Family Safe?**

The following steps should be taken right away to help protect you and your child.

### **Protecting your family from lead in the water:**

- Get your water tested for lead. It's free. Call (810) 787-6537 to learn more.
- Use a water filter in your home. Call 2-1-1 for information on free NSF Certified water filters.
- Run only cold water through the filter.
- If you do not have a water filter, use bottled water for drinking and mixing formula.
- Use filtered or bottled water for drinking (including making coffee, drink mixes, juice, baby formula), and cooking (even if you boil the water, the lead will stay in the water and food).
- You can use unfiltered tap water for washing your hands and washing dishes.
- If you have to use unfiltered water for drinking or cooking, run the tap for five minutes before using the water.

### **Safe cleaning:**

Safe cleaning is important. Keeping your home clean and safe from lead hazards will help to protect your family.

- Buildings built before 1978 could have lead paint in them. Use wet paper towels to clean up paint chips and dust in these older buildings. Be sure to clean around windows, play areas, and floors.
- Wash hands and toys often with soap and water.
- You can use unfiltered tap water to wipe down countertops, mop floors, and wash clothes.

### **Good nutrition:**

Some foods will help keep lead from being stored in a child's body. These are foods with a lot of calcium, iron and vitamin C. These foods include:

<b>Calcium Rich Foods</b>	<b>Iron Rich Foods</b>	<b>Foods with Vitamin C</b>
➤ Milk	➤ Beans	➤ Oranges
➤ Cheese	➤ Lean meats like fish and chicken	➤ Orange juice
➤ Yogurt	➤ Whole grain cereals	➤ Grapefruits
➤ Tofu	➤ Peanut butter	➤ Tomatoes
➤ Spinach		➤ Green peppers

Always wash your fruits with filtered water. If you are concerned about your child's diet, talk with your doctor who may also recommend a daily multivitamin.

WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the **Genesee County WIC office at (810) 237-4537** to learn more. SNAP also offers a Double Bucks program to purchase even more healthy food for no additional costs.

**Where can I get more information on lead?**

- Genesee County Health Department Lead Program  
(810) 257-3833
- Michigan Department of Health and Human Services  
Childhood Lead Poisoning Prevention Program  
(888) 322-4453  
[www.michigan.gov/lead](http://www.michigan.gov/lead)
- United States Environmental Protection Agency  
[www.epa.gov/lead](http://www.epa.gov/lead)
- U.S. Centers for Disease Control and Prevention (CDC) Web site  
[www.cdc.gov/nceh/lead](http://www.cdc.gov/nceh/lead)

These recommendations will stay in effect until the Genesee County Health Department lifts the restrictions on water usage.

Sincerely,

Eden V. Wells, MD, MPH, FACPM  
Chief Medical Executive  
Michigan Department of Health and Human Services

Gary K. Johnson, MD, MPH  
Medical Director  
Genesee County Health Department

October 27, 2015

Dear Provider:

As you may be aware from recent news reports, elevated levels of lead have been found in lead pipes within the City of Flint's water system.

To help protect the children of Flint from the current lead in water exposure, the Genesee County Health Department and Michigan Department of Health and Human Services are contacting you to assist you in providing guidance to support your families.

Children can be exposed to lead from drinking water in that runs through lead pipes, old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass and jewelry making, and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.

As a primary care provider, you play a critical role in helping to ensure that children and families exposed to lead receive the care and reassurances they need to manage the potential health impacts of lead poisoning.

**Identification.** Children suffering from lead poisoning often fail to present outward symptoms. However, early clinical symptoms can include anemia, anorexia, abdominal pain and constipation. Lead is a neuro-toxin, and exposure can result in violent and aggressive behaviors, lead to learning disorders, may cause Attention Deficit Hyperactivity Disorder (ADHD) and has been known to reduce IQ by as many as 5-8 points with levels as low as 10 ug/dL. Lead is metabolized through the gastrointestinal system similar to iron and calcium, with uptake rates depending on the size and weight of the child. The blood half-life of lead is short (approximately 1 month) but the bone half-life can extend into decades.

Due to multiple risk factors facing many residents in the City of Flint (including aging housing conditions and water quality), we recommend that all children under age 6 living in the City of Flint or living in homes that use Flint water, attending school or childcare in Flint, or who spend time with a caregiver in the City of Flint, receive a blood lead test. Blood lead testing should be done through a child's primary care doctor to ensure adequate short-term and long-term follow-up. ***Families should be encouraged to have their children tested immediately either at their doctor's office or the Genesee County Health Department.***

**Management of Blood Lead Levels.** The following guidance is provided for management of childhood blood lead levels:

- **BLL < 5 ug/dL**
  - A lead level of less than 5 mcg/dL is not typically cause for concern.
  - Provide education and anticipatory guidance to ensure that lead levels do not rise.

- Consider retesting in 12 months based on risk factors or concerns.
- **BLL >5 ug/dL**
  - **Children with capillary results of 5 ug/dL and higher must have a confirmatory venous blood draw.**
  - Families should receive anticipatory guidance, nutrition counseling, instruction on safe cleaning techniques and appropriate follow-up care from their primary care provider.
  - In-home services including case management and environmental investigations are available for all children with lead levels greater than 5 ug/dL. Refer patients to the Genesee County Health Department for this service.
  - Children with confirmed venous testing results greater than 5ug/dL within the past 18 months must be retested based on Medicaid policy and AAP guidelines. (See attached “Provider Quick Reference). If a child has not been retested within these timeframes, retesting is recommended as soon as possible.
- **BLL > 44 ug/dL.**
  - **Children with capillary results of 5 ug/dL and higher must have a confirmatory venous blood draw.**
  - Lead levels over 44 ug/dL may require hospitalization. Consult with an expert at the Children’s Hospital of Michigan in Detroit for additional guidance.
  - Families should receive anticipatory guidance, nutrition counseling, instruction on safe cleaning techniques and appropriate follow-up care from their primary care provider.
  - In-home services including case management and environmental investigations are available for all children with lead levels greater than 5 ug/dL. Refer patients to the Genesee County Health Department for this service.
  - Children with confirmed venous testing results greater than 5ug/dL within the past 18 months must be retested based on Medicaid policy and AAP guidelines. (See attached “Provider Quick Reference). If a child has not been retested within these timeframes, retesting is recommended as soon as possible.

**Reminder: All children covered by Medicaid must be tested at age 1 and 2.**

**Follow-up Care.** As providers, there are steps you can take to help support your families:

1. Continue to inform and educate families regarding lead risks and preventative steps that they can take to minimize their risks.
2. Encourage your families to use filtered water for drinking, mixing formula and washing dishes. Families can contact 2-1-1 for information on free NSF Certified water filters.
3. Healthy nutrition is critical for lead-exposed children. Make sure your patients are consuming balanced diets high in iron, calcium and Vitamin C. If you have concerns about their nutrition, consider recommending a multivitamin with iron. WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the Genesee County WIC office at (810) 237-4537 to learn more. In addition, SNAP offers a Double Bucks program that can provide healthy foods for less.

4. Breastfeeding is highly protective and encouraged. However, if the mother's blood lead level rises above 40ug/dL or her level is greater than 20 ug/dL and the baby has a level above 5 ug/dL breastfeeding is not recommended.
5. Because lead is a neuro-toxin, children with lead poisoning need longitudinal follow-up and may require developmental and behavioral health intervention services. Continue monitoring your patients' development at every visit.
6. Consider additional wrap-around and support services that will benefit your patients such as early childhood home visiting programs, early head start and head start. Call 2-1-1 for more information.

**Local Resources.** Several local resources are available to you and your patients:

- Blood Testing. Patients are encouraged to contact their primary care provider for testing. The Genesee County Health Department also administers lead tests. Patients in need of transportation should contact 2-1-1 for assistance.
- Water Testing. Water testing is free through the City of Flint Water Testing Plant. Patients can call 810-787-6537 to learn more.
- WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the Genesee County WIC office at (810) 237-4537 to learn more.
- Child Development. If you have concerns about a child's growth, development or learning contact 2-1-1 for a Home Visiting Program in your area.

Hi Bob,

Just following up on this. Does this report say that we've had 5 EBLLs since 9/28/15? And if so, why does the column next to that say we've had 12 EBLLs this week? Just making sure I'm reading this right!

Angela

**Subject:** RE: BLLs Latest

I can do it. How about this?

- 1) Total number of children tested since 9/28/15 press conference.
- 2) Total number of children with capillary EBLLs since 4/1/14 water change, still needing confirmation.
- 3) Total number of confirmed EBLL cases since 4/1/14.
- 4) Total number of children with capillary EBLLs since 9/28/15, needing confirmation.
- 5) Total number of confirmed EBLL cases since 9/28/15.

We've been having the same conversation here -- yes, we can do that, happy to do that. Bob was starting to work on a format this morning. If you have specific information you would want in a weekly report, let us know, as that will help us to pull what you really need. I know Epi was also talking about a weekly analysis of sorts, which I think would go more in-depth than the counts and such we can give you as a starting point.

Nancy

Hi Nancy and Bob,

Out of curiosity, could we begin looking at pulling some data about recent Flint BLL data? I think all results have to be reported to us within 5 days of the test result, correct?

If so, is there any chance we can begin taking a look at what that data is telling us? Not wanting to do anything with it yet, but just trying to think a little more proactively.

Thanks,

**Angela Minicuci**

Sorry I was triple booked yesterday and had to be somewhere else and could not call in.

Was there a decision made on the REFILL FILTER Distribution?

If so, are volunteers needed through our office?

If so, I need to know where and when!

I need to have something concrete by end of today or first thing tomorrow morning in order to have a chance meeting volunteer staffing needs! Please let me know. If I don't hear anything by 10am tomorrow, then our office will not be able to coordinate the volunteers.

Thank you,

Jen

**Subject:** RE: Genesee County Health Department water filter system daily mass notification - 10.26.15

On behalf of Hilda McShane/Mark Valacak the only update for today is:

This is an informational update and the Genesee County Health Department will provide these updates on a daily basis after 4 pm. We are asking all partners included in this email to provide any pertinent updates **DAILY** to Hilda McShane by 2:00pm. If you have nothing new to share, please inform Hilda that you have no updates at this time.

- 20 water filters delivered to Grand Blanc schools
- Lead testing clinic to be held at Burton Health Center from 8am-5pm on Nov. 5
- Education and Lead testing clinic to be held Nov. 12 at Brownell/Holmes Schools from 2-7pm for ages 0-5.
- GCHD sanitarians to assist DEQ in water testing in the Flint Schools

**Subject:** Genesee County Health Department water filter system daily mass notification - 10.20.15

This is an informational update and the Genesee County Health Department will provide these updates on a daily basis after 4 pm. We are asking all partners included in this email to provide any pertinent updates **DAILY** to Hilda McShane by 2:00pm. If you have nothing new to share, please inform Hilda that you have no updates at this time.

- Genesee County Health Department Community Health Director, Tamara Brickey, connected Chris Mann (GCHD IT consultant) with Ed Berger from MTA to reference the water filter database for an upcoming water filter distribution to disabled clients.
- Tamara Brickey, spoke with Vicki Austin Sacharski from the Disability Network for the purpose of connecting Disability Network clients with water filters. DN will track information of those clients who call in with questions about filters and get the information to GCHD. We will pass that information along to MTA for delivery. GCCARD may be able to assist with installation.
- Tamara is reaching out to a regional representative from DaVita Dialysis to help coordinate the distribution of water filters.
- Department of Health and Human Services has distributed the following:  
113 filters (of which 1 went to daycares)  
10 – 8 cup pitcher  
1 – 23 cup pitcher- to daycare  
Total distributed 124
- Flint Community Schools Superintendent, Bilal Tawab met on Friday, October 16, 2015 with representatives of MDEQ, LARA, and DHHS to discuss a new round of water testing at each of the Flint Community Schools starting on Wednesday, October 21, 2015.

**Subject:** RE: Genesee County Health Department water filter system daily mass notification - 10.19.15

This is an informational update and the Genesee County Health Department will provide these updates on a daily basis after 4 pm. We are asking all partners included in this email to provide any pertinent updates **DAILY** to Hilda McShane by 2:00pm. If you have nothing new to share, please inform Hilda that you have no updates at this time.

- 100 water filters were delivered to Burton location of Planned Parenthood for distribution by GCHD.
- Tamara Brickey (GCHD Community Health Director) and Hilda McShane (GCHD Marketing Specialist), met with MTA about reaching disabled and dialysis patients. MTA will work with GCHD to determine which MTA Your Ride clients may be in need of water filters.
- Another dialysis provider in Flint has requested 30 filters for patients.
- Toni (Nursing Director, GCHD), Jori July (GCHD Immunizations Supervisor) and Hilda McShane met this AM with Molina. Further arrangements with Molina will be made. No date set at this time.
- GCHD is still awaiting communication from Total Health Care.
- Department of Education has come out with a statement that all school age kids in Flint should be lead tested. Our state colleagues along with Toni will work on getting education out to the schools/families regarding getting kids tested.
- Diplomat has a program that they do with physicians about vitamins for kids. Dr. Mona Hanna-Attisha (Hurley) is talking to them about changing the formulary of the vitamin to help with lead issues in kids.
- Jim Henry (GCHD Environmental Health Supervisor) met with DEQ representatives on Friday. DEQ is proposing starting a new round of water testing in all schools receiving Flint water as of Wednesday, October 21, 2015. DEQ is proposing a stakeholder meeting every Friday to discuss updates.

**Subject:** Genesee County Health Department water filter system daily mass notification - 10.16.15

This is an informational update and the Genesee County Health Department will provide these updates on a daily basis after 4 pm. We are asking all partners included in this email to provide any pertinent updates **DAILY** to Hilda McShane by 2:00pm. If you have nothing new to share, please inform Hilda that you have no updates at this time.

- The attached document was provided, emailed, and mailed to 346 licensed food establishments using City of Flint Water by the Genesee County Health Department (GCHD). The Michigan Department of Agriculture and Rural Development (MDARD) emailed and mailed the attached document to: grocery, food processing establishments, and party stores using City of Flint water. This document is available at [www.gchd.us](http://www.gchd.us).
- Michigan Department of Health and Human Services (MDHHS) and Genesee County Community Action Resource Department (GCCARC) distributed 247 water filter systems and 11 water pitchers on 10.15.15.
- The Michigan Childhood Lead Poisoning Prevention Program (CLPPP) created a toolkit to help agency partners, primary care providers and community advocates prepare for lead week, October 25-31, 2015. The Michigan toolkit contains ideas for local lead week activities, a sample press release, sample social media posts and a sample news article. Several CLPPP brochures have also been revised in anticipation of lead week, including the handout for parents, "Is Your Child Safe From Lead?" and a new handout for pregnant and breastfeeding mothers. A CLPPP program profile and a quick reference guide for primary care providers is also in the toolkit.
- Genesee County Health Department Nursing Director, Toni La Rocco, will meet with Molina Healthcare of Michigan representative, Omar Sims, to plan a lead clinic in the near future.
- DaVita Dialysis' Hurley location received 100 water filter systems on 10.16.15 from the Genesee County Health Department.
- Planned Parenthood is scheduled to receive 100 water filter systems on 10.19.15 from the Genesee County Health Department.
- Genesee County Health Department is working with Flint Mass Transit Authority (MTA) to distribute the water filter system to disabled and kidney dialysis YOUR RIDE customers.
- Chris Mann will have additional conversations with the State to discuss updates to the database for tracking filter distribution.
- Genesee County Environmental Health Supervisor, Jim Henry, is meeting with the DEQ laboratory director to discuss future samplings.

**Subject:** RE: Genesee County Health Department water filter system daily mass notification - 10.14.15

This is an informational update and the Genesee County Health Department will provide these updates on a daily basis after 4 pm. We are asking all partners included in this email to provide any pertinent updates **DAILY** to Hilda McShane by 2:00pm. If you have nothing new to share, please inform Hilda that you have no updates at this time.

- As requested by the state of Michigan, Chris Mann of GCHD made all the requested changes to the water filter system database.
- DaVita Dialysis Center has requested 100 water filter systems. Filters will be dropped off Wednesday, October 14.
- Genesee County Health Department will be delivering 100 water filters to Planned Parenthood on Monday, October 19.
- City of Flint Schools' Superintendent is reaching out to his principals requesting input on the distribution of the water filter system to staff and families.
- Dr. Laura Carravallah reached out to Marc Edwards of Virginia Tech regarding the copper levels in the Flint water. Marc did test the Flint water and copper levels in the water are within EPA standards.
- Nursing Director, Toni LaRocco, is finalizing plans for an upcoming lead clinic with McLaren Health Plan on November 5. Toni and staff are in talks with Molina Healthcare of Michigan to schedule another lead clinic.

**Subject:** RE: Genesee County Health Department water filter system daily mass notification - 10.14.15

This is an informational update and the Genesee County Health Department will provide these updates on a daily basis after 4 pm. We are asking all partners included in this email to provide any pertinent updates **DAILY** to Hilda McShane by 2:00pm. If you have nothing new to share, please inform Hilda that you have no updates at this time.

- Chris Mann and GCHD Community Health Director, Tamara Brickey, are working with the State to insert more field information to the current Excel water filter database.
- GCCARD's Lippincott location does not have stable internet connection and because of this, staff are not using the most up-to-date water filter system Excel file. The State is gathering this information and will send Genesee County Health Department their Excel database and we will upload the data on a daily basis.
- Tamara has made contact with Flint Schools. She will make arrangement with staff and student's families to receive a water filter system. A date for the filter distribution to staff and student's families has not been set.
- Jim Henry, GCHD Environmental Health Supervisor got a call from State. They are looking for our staff to do another round of sampling at all Flint schools who receive city of Flint water.
- Planned Parenthood will receive 100 water filters for distribution to their clients.
- GCHD will be making contact with the Disability Network to continue planning to reach the disabled population within Flint that need assistance obtaining a water filter.
- MDEQ reached out to the CDC regarding the effects of bathing in water contaminated with lead. The experts are looking further into this matter. See attached FAQ Flint Water Fact sheet.
- Dr. Caravella of GCHD's Board of Health is concerned whether the distributed water filter systems will remove copper. She is concerned about individuals in the community who have a rare condition related to copper.
- Jim Henry is working to receive lab results in a timely manner.
- GCHD Director of Nursing, Toni LaRocco had a conversation with various individuals from the State regarding blood lead clinic. Toni is working to implement an upcoming lead clinic for children, 0-5 scheduled with McLaren Health Plan. Toni is reaching out to the University of Michigan – Flint to have students and faculty present at all clinics. Toni is working on other locations to host clinics with other health plans. The first message for people should be that the first choice in testing should be at their primary care provider.
- FAQs regarding lead and water for providers and public will be released in future from MDHHS.
- As of October 13 the total distribution for both DHHS and GCCARD is 8447.
- 336 filters and pitchers were distributed on 10/13 by DHHS and GCCARD.
- Daycares also began picking up filters and pitchers on yesterday as well from GCCARD.

**Subject:** Genesee County Health Department water filter system daily mass notification - 10.13.15

This is an informational update and the Genesee County Health Department will provide these updates on a daily basis after 4 pm. We are asking all partners included in this email to provide any pertinent updates **DAILY** to Hilda McShane by 2:00pm. If you have nothing new to share, please inform Hilda that you have no updates at this time.

- 20,000 filters + 9,000 replacement filters have been delivered to Genesee County Community Action Resource Department (GCARD) and Michigan Department Health Human Services (MDHHS).
- We are reminding partners to blackout the barcode on filter boxes before distribution.
- As of 10.13.15 Flint Housing Commission has distributed water filters to all of its housing units.
- Valley Area Agency on Aging (VAAA) is creating a list of homebound seniors. Three (3) state employees and Five (5) GCCARD employees are working through that list and will help with home installation.
- Distribution has been completed at Rosehaven Manor, Court Street Commons, Riverfront Dorms, Job Corp, and University of Michigan-Flint international student population
- Municipalities with residents that receive Flint City water will be contacted and asked to be the distribution point for the water filter system in their area by the City of Flint.
- Eileen Tomasi from Flint Schools has asked to use the elementary schools as water filter distribution points for both staff living in Flint and parents of school children. GCHD is awaiting a follow up conversation with the Flint Community Schools.
- Genesee County Health Department (GCHD) is starting to see an increase in requests for blood lead testing. GCHD Nursing Director, Toni LaRocco, is working with McLaren Health Plan to develop a lead clinic in November. University of Michigan-Flint has offered nursing students to assist at the clinic. Adults can use the Genesee County Health Department's Primary Care Clinic and the Health Department will bill insurance, or go on standing orders.
- Total filters distributed by MDHHS and GCCARD, 8,000. Genesee County Health Department has distributed 4,000 filters, which include approximately 2,700 to the public, 100 to Wellness Services, 100 to GCHD Primary Care Clinic, 100 to WIC, 100 to Reverence, and 375 to Hurley Maternal Infant Health Home Visiting Services.

Testing water in homes: Of 240 samples tested from households on Flint water, One zip code (48503) over 75 % were 5 ppb or lower. 90% were at 10 or below. " We now know where the problem is and we can address it."

Freeman School water testing results were consistent. 31 samples were taken. 30 out of 31 sites were able to get to 5 ppb. Only 9 samples exceeded 15 ppb on first or second draw. They will be taking further samples. Results indicate the lead is likely from connecting plumbing. Replacing faucets at the schools will be recommended. This is the responsibility of the schools. The city said that there are no lead service lines to the schools.

DEQ is planning to take samples at Eisenhower and Brownell schools on Saturday.

**Subject:** Genesee County Health Department water filter system daily mass notification - 10.20.15

This is an informational update and the Genesee County Health Department will provide these updates on a daily basis after 4 pm. We are asking all partners included in this email to provide any pertinent updates **DAILY** to Hilda McShane by 2:00pm. If you have nothing new to share, please inform Hilda that you have no updates at this time.

- Genesee County Health Department Community Health Director, Tamara Brickey, connected Chris Mann (GCHD IT consultant) with Ed Berger from MTA to reference the water filter database for an upcoming water filter distribution to disabled clients.
- Tamara Brickey, spoke with Vicki Austin Sacharski from the Disability Network for the purpose of connecting Disability Network clients with water filters. DN will track information of those clients who call in with questions about filters and get the information to GCHD. We will pass that information along to MTA for delivery. GCCARD may be able to assist with installation.
- Tamara is reaching out to a regional representative from DaVita Dialysis to help coordinate the distribution of water filters.
- Department of Health and Human Services has distributed the following:  
113 filters (of which 1 went to daycares)  
10 – 8 cup pitcher  
1 – 23 cup pitcher- to daycare  
Total distributed 124
- Flint Community Schools Superintendent, Bilal Tawab met on Friday, October 16, 2015 with representatives of MDEQ, LARA, and DHHS to discuss a new round of water testing at each of the Flint Community Schools starting on Wednesday, October 21, 2015.

**Subject:** RE: Genesee County Health Department water filter system daily mass notification - 10.19.15

This is an informational update and the Genesee County Health Department will provide these updates on a daily basis after 4 pm. We are asking all partners included in this email to provide any pertinent updates **DAILY** to Hilda McShane by 2:00pm. If you have nothing new to share, please inform Hilda that you have no updates at this time.

- 100 water filters were delivered to Burton location of Planned Parenthood for distribution by GCHD.
- Tamara Brickey (GCHD Community Health Director) and Hilda McShane (GCHD Marketing Specialist), met with MTA about reaching disabled and dialysis patients. MTA will work with GCHD to determine which MTA Your Ride clients may be in need of water filters.
- Another dialysis provider in Flint has requested 30 filters for patients.
- Toni (Nursing Director, GCHD), Jori July (GCHD Immunizations Supervisor) and Hilda McShane met this AM with Molina. Further arrangements with Molina will be made. No date set at this time.
- GCHD is still awaiting communication from Total Health Care.
- Department of Education has come out with a statement that all school age kids in Flint should be lead tested. Our state colleagues along with Toni will work on getting education out to the schools/families regarding getting kids tested.
- Diplomat has a program that they do with physicians about vitamins for kids. Dr. Mona Hanna-Attisha (Hurley) is talking to them about changing the formulary of the vitamin to help with lead issues in kids.
- Jim Henry (GCHD Environmental Health Supervisor) met with DEQ representatives on Friday. DEQ is proposing starting a new round of water testing in all schools receiving Flint water as of Wednesday, October 21, 2015. DEQ is proposing a stakeholder meeting every Friday to discuss updates.

**Subject:** Genesee County Health Department water filter system daily mass notification - 10.16.15

This is an informational update and the Genesee County Health Department will provide these updates on a daily basis after 4 pm. We are asking all partners included in this email to provide any pertinent updates **DAILY** to Hilda McShane by 2:00pm. If you have nothing new to share, please inform Hilda that you have no updates at this time.

- The attached document was provided, emailed, and mailed to 346 licensed food establishments using City of Flint Water by the Genesee County Health Department (GCHD). The Michigan Department of Agriculture and Rural Development (MDARD) emailed and mailed the attached document to: grocery, food processing establishments, and party stores using City of Flint water. This document is available at [www.gchd.us](http://www.gchd.us).
- Michigan Department of Health and Human Services (MDHHS) and Genesee County Community Action Resource Department (GCCARC) distributed 247 water filter systems and 11 water pitchers on 10.15.15.
- The Michigan Childhood Lead Poisoning Prevention Program (CLPPP) created a toolkit to help agency partners, primary care providers and community advocates prepare for lead week, October 25-31, 2015. The Michigan toolkit contains ideas for local lead week activities, a sample press release, sample social media posts and a sample news article. Several CLPPP brochures have also been revised in anticipation of lead week, including the handout for parents, "Is Your Child Safe From Lead?" and a new handout for pregnant and breastfeeding mothers. A CLPPP program profile and a quick reference guide for primary care providers is also in the toolkit.
- Genesee County Health Department Nursing Director, Toni La Rocco, will meet with Molina Healthcare of Michigan representative, Omar Sims, to plan a lead clinic in the near future.
- DaVita Dialysis' Hurley location received 100 water filter systems on 10.16.15 from the Genesee County Health Department.
- Planned Parenthood is scheduled to receive 100 water filter systems on 10.19.15 from the Genesee County Health Department.
- Genesee County Health Department is working with Flint Mass Transit Authority (MTA) to distribute the water filter system to disabled and kidney dialysis YOUR RIDE customers.
- Chris Mann will have additional conversations with the State to discuss updates to the database for tracking filter distribution.
- Genesee County Environmental Health Supervisor, Jim Henry, is meeting with the DEQ laboratory director to discuss future samplings.

**Subject:** RE: Genesee County Health Department water filter system daily mass notification - 10.14.15

This is an informational update and the Genesee County Health Department will provide these updates on a daily basis after 4 pm. We are asking all partners included in this email to provide any pertinent updates **DAILY** to Hilda McShane by 2:00pm. If you have nothing new to share, please inform Hilda that you have no updates at this time.

- As requested by the state of Michigan, Chris Mann of GCHD made all the requested changes to the water filter system database.
- DaVita Dialysis Center has requested 100 water filter systems. Filters will be dropped off Wednesday, October 14.
- Genesee County Health Department will be delivering 100 water filters to Planned Parenthood on Monday, October 19.
- City of Flint Schools' Superintendent is reaching out to his principals requesting input on the distribution of the water filter system to staff and families.
- Dr. Laura Carravallah reached out to Marc Edwards of Virginia Tech regarding the copper levels in the Flint water. Marc did test the Flint water and copper levels in the water are within EPA standards.
- Nursing Director, Toni LaRocco, is finalizing plans for an upcoming lead clinic with McLaren Health Plan on November 5. Toni and staff are in talks with Molina Healthcare of Michigan to schedule another lead clinic.

**Subject:** RE: Genesee County Health Department water filter system daily mass notification - 10.14.15

This is an informational update and the Genesee County Health Department will provide these updates on a daily basis after 4 pm. We are asking all partners included in this email to provide any pertinent updates **DAILY** to Hilda McShane by 2:00pm. If you have nothing new to share, please inform Hilda that you have no updates at this time.

- Chris Mann and GCHD Community Health Director, Tamara Brickey, are working with the State to insert more field information to the current Excel water filter database.
- GCCARD's Lippincott location does not have stable internet connection and because of this, staff are not using the most up-to-date water filter system Excel file. The State is gathering this information and will send Genesee County Health Department their Excel database and we will upload the data on a daily basis.
- Tamara has made contact with Flint Schools. She will make arrangement with staff and student's families to receive a water filter system. A date for the filter distribution to staff and student's families has not been set.
- Jim Henry, GCHD Environmental Health Supervisor got a call from State. They are looking for our staff to do another round of sampling at all Flint schools who receive city of Flint water.
- Planned Parenthood will receive 100 water filters for distribution to their clients.
- GCHD will be making contact with the Disability Network to continue planning to reach the disabled population within Flint that need assistance obtaining a water filter.

- MDEQ reached out to the CDC regarding the effects of bathing in water contaminated with lead. The experts are looking further into this matter. See attached FAQ Flint Water Fact sheet.
- Dr. Caravella of GCHD's Board of Health is concerned whether the distributed water filter systems will remove copper. She is concerned about individuals in the community who have a rare condition related to copper.
- Jim Henry is working to receive lab results in a timely manner.
- GCHD Director of Nursing, Toni LaRocco had a conversation with various individuals from the State regarding blood lead clinic. Toni is working to implement an upcoming lead clinic for children, 0-5 scheduled with McLaren Health Plan. Toni is reaching out to the University of Michigan – Flint to have students and faculty present at all clinics. Toni is working on other locations to host clinics with other health plans. The first message for people should be that the first choice in testing should be at their primary care provider.
- FAQs regarding lead and water for providers and public will be released in future from MDHHS.
- As of October 13 the total distribution for both DHHS and GCCARD is 8447.
- 336 filters and pitchers were distributed on 10/13 by DHHS and GCCARD.
- Daycares also began picking up filters and pitchers on yesterday as well from GCCARD.

---

**Subject:** Genesee County Health Department water filter system daily mass notification - 10.13.15

This is an informational update and the Genesee County Health Department will provide these updates on a daily basis after 4 pm. We are asking all partners included in this email to provide any pertinent updates **DAILY** to Hilda McShane by 2:00pm. If you have nothing new to share, please inform Hilda that you have no updates at this time.

- 20,000 filters + 9,000 replacement filters have been delivered to Genesee County Community Action Resource Department (GCARD) and Michigan Department Health Human Services (MDHHS).
- We are reminding partners to blackout the barcode on filter boxes before distribution.
- As of 10.13.15 Flint Housing Commission has distributed water filters to all of its housing units.
- Valley Area Agency on Aging (VAAA) is creating a list of homebound seniors. Three (3) state employees and Five (5) GCCARD employees are working through that list and will help with home installation.
- Distribution has been completed at Rosehaven Manor, Court Street Commons, Riverfront Dorms, Job Corp, and University of Michigan-Flint international student population

- Municipalities with residents that receive Flint City water will be contacted and asked to be the distribution point for the water filter system in their area by the City of Flint.
- Eileen Tomasi from Flint Schools has asked to use the elementary schools as water filter distribution points for both staff living in Flint and parents of school children. GCHD is awaiting a follow up conversation with the Flint Community Schools.
- Genesee County Health Department (GCHD) is starting to see an increase in requests for blood lead testing. GCHD Nursing Director, Toni LaRocco, is working with McLaren Health Plan to develop a lead clinic in November. University of Michigan-Flint has offered nursing students to assist at the clinic. Adults can use the Genesee County Health Department's Primary Care Clinic and the Health Department will bill insurance, or go on standing orders.
- Total filters distributed by MDHHS and GCCARD, 8,000. Genesee County Health Department has distributed 4,000 filters, which include approximately 2,700 to the public, 100 to Wellness Services, 100 to GCHD Primary Care Clinic, 100 to WIC, 100 to Reverence, and 375 to Hurley Maternal Infant Health Home Visiting Services.

**Genesee County  
Health Department**

## Pregnant Woman

If you are exposed to lead when pregnant, the lead can be passed on to your fetus, possibly causing:

- premature birth
- a smaller baby
- learning difficulties
- slower growth in young kids

## Healthy Adult

You are at lower risk of health problems from small amounts of lead.

Most health problems that come from lead in adults are because they are exposed to a lot of it at their job - whether they are in painting or construction or work at a factory where lead is used in a product.

If you work with lead, you should have regular blood tests to make sure you're not getting too much into your body.

## Kids

Even small amounts of lead can harm kids' health. Your doctor can do a simple blood test to find out if your child has been exposed to lead. Some possible signs of lead poisoning include:

- a bad stomachache
- muscle weakness
- paleness (caused by anemia)

Over time lead can affect a kid's

- brain development
- growth rate

## How Does Lead Get Into Your Body?

**Eating and breathing lead dust is the most common way lead gets into your body.**

- When kids accidentally eat lead, up to 50% can be absorbed into their bodies, compared to 3 to 10% for adults. This is why protecting kids from even small amounts of lead is important.

**Lead does not absorb into your skin quickly or at high levels.**

- The CDC reviewed a study where a cream with high levels of lead was put on the skin of adults. The cream was left on their skin for 12 hours. The amount of lead that soaked into their skin was very, very small (less than 0.3 percent).
- Taking a shower or bath in water containing lead at levels found in most tap water in Michigan is unlikely to be a problem for anyone, including kids.

If you think you or your children have been exposed to lead, please talk to your doctor or health department about getting a simple blood test to measure how much lead might be in your body.

For more information on protecting yourself and your family from lead, please visit: [www.michigan.gov/lead](http://www.michigan.gov/lead), or you can call the Michigan Department of Health and Human Services at 1-800-648-6942. We will help direct you to the best department that can answer your questions about lead in your home.

You can also call the Flint Water Department at 810-787-6537 to request a free or low-cost water test.

If you use City of Flint water, you can call 211 to find out where you can pick up a free NSF-approved water filter.

# Frequently Asked Questions About Lead in Flint Water

- Lead is hard to avoid completely. It can be found in old paint, water pipes and brass water faucets, in dirt, at some job sites, and in metal used for some hobbies.
- The amount of lead found in some Flint homes' drinking water could affect kids' health.
  - Even small amounts of lead can harm kids' health because they are little and still growing.
  - Adults are less likely to be harmed by the levels found in the water.
- Filter your drinking water using a NSF-approved filter.
  - Find a NSF-approved filter at [http://www.gchd.us/docs/lead\\_filter\\_information.pdf](http://www.gchd.us/docs/lead_filter_information.pdf).
  - If you use City of Flint water, you can call 211 to find out where you can pick up a free water filter.
- Some filters can remove up to 99% of the lead in water when used properly. To be sure your filter is removing as much lead as it can, carefully follow the instructions that came with it.
  - Change the filter cartridge as often as you should.
  - Run only cold water through the filter.
- Even after changes to the water system, it may take a while before lead levels in your home's water drop. Use the tips below to know when it's best to use filtered water:

## Lead in Water

Although your water may be a different color sometimes, it is not caused by lead. It's important to remember:

- You can't see, smell, or taste lead in water.
- Lead won't change the color of your water.
- The only way to know what your home's lead levels are is by having your water tested in a lab.

Please call the Flint Water Department at 810-787-6537 to request a free or low-cost water test.

## In The Kitchen

Use filtered tap water for:

- Drinking (including making coffee, drink mixes, juice, baby formula)
- Cooking (even if you boil the water, the lead will stay in the water and food)
- Washing fruits and vegetables

You can use unfiltered tap water for:

- Washing your hands
- Washing dishes
- Wiping down countertops

## Cleaning

You can use unfiltered tap water for:

- Mopping floors
- Washing clothes

Your washing machine and dryer won't put lead from the water into the air of your home.

## In the Bathroom

Use filtered tap water for:

- Brushing kids' teeth

You can use unfiltered tap water for:

- Showers
- Baths (don't let kids drink the water as they play in the tub)
- Brushing your teeth (if you are an adult)

Lead will not cause rashes or other skin problems. However, if chlorine levels or other cleaners are high in the water, it may cause itchy or dry skin (similar to what can happen when you swim in a pool).

## Caring for Pets

Use filtered tap water for:

- Pets' water bowls

You can use unfiltered tap water for:

- Baths

If you notice your pet acting differently than normal, please contact your vet.

## Other Sources of Lead in Your Home

### Lead Paint

- Homes built before 1978 likely have lead paint, both inside and outside.
- Old paint is the most common way that kids are exposed to lead.

### Dirt

- If you live in the city, there may be lead in the dirt outside your home.
- Before 1996, gas and the exhaust from cars contained lead. More lead will be found in dirt in busy traffic areas.

### Dust

- The dust in your home can contain tiny amounts of both the paint and the dirt that contain lead.

### Hobbies & Jobs

- Solder, fishing sinkers, bullets, and stained glass framing materials are some of the items in your home that may contain lead. You could also track home lead dust from your job site.

## Have Questions?

For more information about protecting yourself and your family from lead, please visit:

[www.michigan.gov/lead](http://www.michigan.gov/lead)

Or you can call the Michigan Department of Health and Human Services at:

**1-800-648-6942**

The staff at this number will help direct you to the best department that can answer your questions about lead in your home.

To request a free or low-cost water test, please call the Flint Water Department at:

**1-810-787-6537**

To find out if you can get a free water filter, please call 211.

**To:** Wells, Eden (DHHS)  
**Cc:** 'Lawrence Reynolds'; 'gdn2@aol.com'; Peter Levine; Mark Valacak  
**Subject:** Breast feeding and maternal lead exposure

Dear Eden,

Our county medical society is in the process of drafting a “fact sheet” specifically for our physician members to try and help them help their patients. We are endeavoring to keep the content consistent with the other messaging going out, but to use as many channels as we can, and to make this very easy for physicians to digest (i.e. brief and pertinent to their patients). I am attaching our draft to this email, as well as some of the articles that we have found.

One of the questions that came up is what to tell lead-exposed mothers who are pregnant or breastfeeding. We have pulled a number of articles that talk about lower maternal BLLs, but these are usually in the context of lower lead levels in drinking water. We are not sure if these recommendations still hold in our situation: the water is variable, the mothers are not routinely tested (should they be?), and lead is released from maternal bone for a long time. We also read that the lead levels fluctuate. All of this is to say, we are not certain that breastfeeding is safer than using filtered water in our situation (though it pains us as pediatricians and family docs to suggest this) and also, what the safe BLL is for a mother? The MDHHS recommendation of 40 in the recent Lead Week Toolkits seemed high, considering the fluctuating BLL and bone storage.

You had previously asked your toxicologist about the copper levels for us, and I was hoping you might pose this question to them as well.

Thank you for your help!

Laura Carravallah, MD

# PREGNANT AND NURSING MOTHERS

## WHAT YOU NEED TO KNOW ABOUT LEAD POISONING

### What causes lead poisoning?

There are many factors that can put a pregnant woman or nursing mother at risk for lead poisoning.

In Michigan, lead paint is still the #1 cause of lead poisoning. It is often found in homes built before 1978 and the older the home, the more likely that painted surfaces like windows, cupboards, doors and porches will contain lead paint.

Other sources of exposure may include soil and water or jobs and hobbies using lead such as factory work, soldering, ammunitions or jewelry making. Some pottery glazes, imported spices and home remedies may also contain lead.

### Should I get tested?

Routine blood testing is NOT recommended for all pregnant women or nursing mothers. Talk to your doctor or local health department to learn more.

**If I test positive for lead poisoning can I continue to breastfeed?**

In most cases, breastfeeding is safe. However, if your blood lead level goes above 40 ug/dl or your level is greater than 20 ug/dl and your baby has a level above 5 ug/dl, you should talk with your doctor about continuing to breastfeed.

### What can I do to protect myself from lead?

- Wash hands, bottles, pacifiers and toys often.
- Always take off shoes before going into the house.
- Flush your pipes before drinking, and only use cold water for drinking or mixing formula. Flush pipes by running the water for approximately 5 minutes.
- Watch your diet carefully. Foods high in calcium and iron help keep lead from being absorbed by your body.
- Avoid using power sanders, open-flame torches, heat guns, dry scrapers and dry sandpaper on painted surfaces.
- Fix peeling or chipping paint.
- Use a certified Repair and Remodeling Professional when making updates to your home.
- Practice safe cleaning methods.

To learn more about lead poisoning prevention and blood lead testing, call:

# CHILDHOOD LEAD POISONING

## Blood Lead Level (BLL) Quick Reference for Primary Care Providers

### Not Yet Tested

Consider screening ALL children between ages 1-6

Need for testing can be based on risk factors

REMINDER: Medicaid requires all children to be tested at ages 1 & 2. Children who were not tested between 1 & 2 must be tested at least once between 3 & 6.

### BLL <5

Review lead levels with family

Provide anticipatory guidance

REMINDER: Medicaid requires all children to be tested at ages 1 & 2. Children who were not tested between 1 & 2 must be tested at least once between 3 & 6.

### BLL 5-14

Review lead levels with family

Confirm results with venous blood sample

Review venous sample with family

Perform environmental history. Consider other children who may be exposed

Consider iron sufficiency, provide nutritional counseling r/t calcium and iron

Provide anticipatory guidance

Refer to case management

**FOLLOW UP:** Retest venous sample within 1-3 months to ensure BLL is not rising

REMINDER: Medicaid requires all children to be tested at ages 1 & 2. Children who were not tested between 1 & 2 must be tested at least once between 3 & 6.

### BLL 15-44

Review lead levels with family

Confirm results with venous blood sample

Perform environmental history. Consider other children who may be exposed

Consider if a specific evaluation of the child is necessary such as an abdominal x-ray. Gut decontamination may be needed if leaded foreign bodies are visualized in x-ray

Consider iron sufficiency, provide nutritional counseling r/t calcium and iron

Refer to case management

**FOLLOW UP:** Retest venous sample monthly until levels are <15, repeat every 1-3 months until levels are <5

REMINDER: Medicaid requires all children to be tested at ages 1 & 2. Children who were not tested between 1 & 2 must be tested at least once between 3 & 6.

### BLL >44

Review lead levels with family

Confirm results with venous blood sample

Review venous sample with family

Any treatment at this level should be performed in consultation with an expert at Children's Hospital of Michigan in Detroit.

**FOLLOW UP:** As directed by expert. Monthly venous samples will be required.

REMINDER: Medicaid requires all children to be tested at ages 1 & 2. Children who were not tested between 1 & 2 must be tested at least once between 3 & 6.

# PREGNANT AND NURSING MOTHERS

## WHAT YOU NEED TO KNOW ABOUT LEAD POISONING

### What causes lead poisoning?

There are many factors that can put a pregnant woman or nursing mother at risk for lead poisoning.

In Michigan, lead paint is still the #1 cause of lead poisoning. It is often found in homes built before 1978 and the older the home, the more likely that painted surfaces like windows, cupboards, doors and porches will contain lead paint.

Other sources of exposure may include soil and water or jobs and hobbies using lead such as factory work, soldering, ammunitions or jewelry making. Some pottery glazes, imported spices and home remedies may also contain lead.

### Should I get tested?

Routine blood testing is NOT recommended for all pregnant women or nursing mothers. Talk to your doctor or local health department to learn more.

**If I test positive for lead poisoning can I continue to breastfeed?**

In most cases, breastfeeding is safe. However, if your blood lead level goes above 40 ug/dl or your level is greater than 20 ug/dl and your baby has a level above 5 ug/dl, you should talk with your doctor about continuing to breastfeed.

### What can I do to protect myself from lead?

- Wash hands, bottles, pacifiers and toys often.
- Always take off shoes before going into the house.
- Flush your pipes before drinking, and only use cold water for drinking or mixing formula. Flush pipes by running the water for approximately 5 minutes.
- Watch your diet carefully. Foods high in calcium and iron help keep lead from being absorbed by your body.
- Avoid using power sanders, open-flame torches, heat guns, dry scrapers and dry sandpaper on painted surfaces.
- Fix peeling or chipping paint.
- Use a certified Repair and Remodeling Professional when making updates to your home.
- Practice safe cleaning methods.

To learn more about lead poisoning prevention and blood lead testing, call:  
**(888) 322-4453**

**This Document is a Non-Responsive Attachment.**

# IS YOUR CHILD SAFE FROM LEAD POISONING?

## LEARN HOW TO PROTECT YOUR FAMILY: CREATE A LEAD SAFE HOME

### What causes lead poisoning?

There are many places in a home that can put babies and children in danger of lead poisoning.

Lead paint is the #1 cause of lead poisoning in Michigan and is often found in homes built before 1978. The older the home, the more likely that painted surfaces like windows, cupboards, doors and porches will contain lead paint.

Lead poisoning occurs most often when children come in contact with lead in the air, in dust and in lead paint. Lead can also be found in soil, drinking water if supplied by lead pipes, certain home remedies and is used in some hobbies and occupations.

Exposure to lead is a serious health threat. Carefully consider where your child spends time (childcare, relatives, your home) when thinking about lead poisoning hazards.

### How can I tell if my child has lead poisoning?

Talk to your doctor about testing your child's blood for lead poisoning.

#### When should my child be tested for lead poisoning?

Children should be tested at one and two years of age or if you think your child has been exposed to a lead.

To learn more about lead poisoning prevention and blood lead testing, call the Childhood Lead Poisoning Prevention Project:

**(517) 335-8885**

**(888) 322-4453**

### Take this quiz to see if your child may have lead poisoning:

Symptoms of lead poisoning can be silent—and hard to recognize. Preventing lead poisoning before it happens is the best way to keep your family safe. Take this quiz to see if your child may be at risk:

Does your child currently live in a home built before 1950 or have they lived in a home built before 1950 in the recent past? Do they spend time at or often visit a home built before 1950?

Yes No Don't know

Does your child currently live in a home built before 1978 that was recently remodeled? Have they lived in or often visited a home built before 1978 that was recently remodeled?

Yes No Don't know

Does your child have a brother, sister or playmate with lead poisoning?

Yes No Don't know

Does your child live with an adult whose job or hobby involves lead?

Yes No Don't know

Do you or your child's caregiver use home remedies that may contain lead?

Yes No Don't know

If you answered NO to all of these questions, your child is probably not at risk for lead poisoning.

If you answered YES or DON'T KNOW to any of these questions, talk to your doctor about testing your child for lead poisoning.

# MAKE EVERY DAY LEAD SAFE

**Safe Cleaning.** Use these steps to help keep your home clean and reduce your child's risk of exposure. Use these tips to clean your windows, doors, floors, porches, stairs and child play areas.

**Put on rubber gloves.** If you do not have rubber gloves, wash your hands well after cleaning.

**Use the right cleaners and supplies you can throw away.** Use soapy cleaners or products made to remove lead dust.

**Remove paint chips first.** Window areas and porches often have peeling paint and lead dust. Pick up paint chips you can see and throw them away in a plastic bag.

**Always wet-mop floors and window sills.** Do not broom lead dust. Throw away cloths after wiping each area. Replace mop water frequently.

**Don't use a vacuum unless it is a HEPA vacuum.** A regular vacuum will spread lead dust into the air you breathe. Some health departments have HEPA vacuums available to borrow.

**Rinse after cleaning.** Use clean water and a new mop head or fresh paper towels to wipe away suds.

**Always empty wash water down a toilet.**

**Repeat these steps weekly,** or when dirt and dust appear on floors, porches, window wells, window sills, stairs and children's play areas.

## For Homes with Lead Pipes

**If you use a water filter,** be sure it meets NSF/ANSI 53 standards for lead reduction.

✓ **Flush your pipes before drinking,** and only use cold water for cooking and mixing formula. Flush pipes by running the water for approximately 5 minutes.

✓ **Test.** Consider contacting your local water authority to have your water tested.

## Daily Lead Safe Practices

- Wash hands, bottles, pacifiers and toys often.
- Always take off shoes before going into the house.
- Watch your child's diet. Foods high in calcium and iron help keep lead from being absorbed by a child's body.
- Avoid using power sanders, open-flame torches, heat guns, dry scrapers and dry sandpaper or heat guns on painted surfaces.
- Paint over peeling or chipping paint.
- Use a certified Repair and Remodeling Professional when making updates to your home.
- Always use the safe cleaning methods listed above.

Thinking about remodeling your home? Need advice about identifying and removing lead paint? Call the Lead and Healthy Homes Section: 866-691-LEAD.

**This Document is a Non-Responsive Attachment.**

# Help Fight Lead Poisoning with a Healthy Diet

## Regularly Eat Healthy Foods

Children with empty stomachs absorb more lead than children with full stomachs.

Provide your child with four to six small meals during the day. The following nutrients can help protect your child from lead poisoning:

### Iron-Rich Foods

Normal levels of iron work to protect the body from the harmful effects of lead. Good sources of dietary iron include:

Lean red meats, fish, and chicken

Iron-fortified cereals

Dried fruits (raisins, prunes)

### Calcium-Rich Foods

Calcium reduces lead absorption and also helps make teeth and bones strong. Good sources of dietary calcium include:

Milk

Yogurt

Cheese

Green leafy vegetables (spinach, kale, collard greens)

### Vitamin C-Rich Foods

Vitamin C and iron-rich foods work together to reduce lead absorption. Good sources of vitamin C include:

Oranges, orange juice

Grapefruits, grapefruit juice

Tomatoes, tomato juice

Green peppers

# Simple Steps You Can Take

## to Protect Your Family from Lead Hazards

---

### If you think your home has high levels of lead:

- Make sure your children eat healthy, low-fat foods high in iron, calcium, and vitamin C.
- Get your children tested for lead, even if they seem healthy.
- Get your home tested for lead if it was built before 1978. Call 1-800-424-LEAD for more information.
- Always wash your hands before eating.
- Wash children's hands, bottles, pacifiers, and toys.
- Do not use imported pottery to store or serve food.
- Let tap water run for one minute before using.
- Use only cold water for making your baby's formula, drinking, and cooking.
- Regularly clean floors, windowsills, and other surfaces using wet methods that control dust.
- Wipe or remove shoes before entering your house.
- If you rent, it is your landlord's job to keep paint in good shape. Report peeling or chipping paint to your landlord and call your health department if the paint is not repaired safely.
- Take precautions to avoid exposure to lead dust when remodeling or renovating.
- Don't try to remove paint yourself!

---

# Frequently Asked Questions About Lead in Flint Water

- Lead is hard to avoid completely. It can be found in old paint, water pipes and brass water faucets, in dirt, at some job sites, and in metal used for some hobbies.
- The amount of lead found in some Flint homes' drinking water could affect kids' health.
  - Even small amounts of lead can harm kids' health because they are little and still growing.
  - Adults are less likely to be harmed by the levels found in the water.
- Filter your drinking water using a NSF-approved filter.
  - Find a NSF-approved filter at [http://www.gchd.us/docs/lead\\_filter\\_information.pdf](http://www.gchd.us/docs/lead_filter_information.pdf).
  - If you use City of Flint water, you can call 211 to find out where you can pick up a free water filter.
- Some filters can remove up to 99% of the lead in water when used properly. To be sure your filter is removing as much lead as it can, carefully follow the instructions that came with it.
  - Change the filter cartridge as often as you should.
  - Run only cold water through the filter.
- Even after changes to the water system, it may take a while before lead levels in your home's water drop. Use the tips below to know when it's best to use filtered water:

## Lead in Water

Although your water may be a different color sometimes, it is not caused by lead. It's important to remember:

- You can't see, smell, or taste lead in water.
- Lead won't change the color of your water.
- The only way to know what your home's lead levels are is by having your water tested in a lab.

Please call the Flint Water Department at 810-787-6537 to request a free or low-cost water test.

## In The Kitchen

Use filtered tap water for:

- Drinking (including making coffee, drink mixes, juice, baby formula)
- Cooking (even if you boil the water, the lead will stay in the water and food)
- Washing fruits and vegetables

You can use unfiltered tap water for:

- Washing your hands
- Washing dishes
- Wiping down countertops

## Cleaning

You can use unfiltered tap water for:

- Mopping floors
- Washing clothes

Your washing machine and dryer won't put lead from the water into the air of your home.

## In the Bathroom

Use filtered tap water for:

- Brushing kids' teeth

You can use unfiltered tap water for:

- Showers
- Baths (don't let kids drink the water as they play in the tub)
- Brushing your teeth (if you are an adult)

Lead will not cause rashes or other skin problems. However, if chlorine levels or other cleaners are high in the water, it may cause itchy or dry skin (similar to what can happen when you swim in a pool).

## Caring for Pets

Use filtered tap water for:

- Pets' water bowls

You can use unfiltered tap water for:

- Baths

If you notice your pet acting differently than normal, please contact your vet.

## Other Sources of Lead in Your Home

### Lead Paint

- Homes built before 1978 likely have lead paint, both inside and outside.
- Old paint is the most common way that kids are exposed to lead.

### Dirt

- If you live in the city, there may be lead in the dirt outside your home.
- Before 1996, gas and the exhaust from cars contained lead. More lead will be found in dirt in busy traffic areas.

### Dust

- The dust in your home can contain tiny amounts of both the paint and the dirt that contain lead.

### Hobbies & Jobs

- Solder, fishing sinkers, bullets, and stained glass framing materials are some of the items in your home that may contain lead. You could also track home lead dust from your job site.

## Have Questions?

For more information about protecting yourself and your family from lead, please visit:

[www.michigan.gov/lead](http://www.michigan.gov/lead)

Or you can call the Michigan Department of Health and Human Services at:

**1-800-648-6942**

The staff at this number will help direct you to the best department that can answer your questions about lead in your home.

To request a free or low-cost water test, please call the Flint Water Department at:

**1-810-787-6537**

To find out if you can get a free water filter, please call 211.

**This Document is a Non-Responsive Attachment.**

October 30, 2015

Dear Provider:

As you may be aware from recent news reports, elevated levels of lead have been found in lead pipes within the City of Flint's water system.

To help protect the children of Flint from the current lead in water exposure, the Genesee County Health Department and Michigan Department of Health and Human Services are contacting you to assist you in providing guidance to support your families.

Children can be exposed to lead from drinking water in that runs through lead pipes, old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass and jewelry making, and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.

As a primary care provider, you play a critical role in helping to ensure that children and families exposed to lead receive the care and reassurances they need to manage the potential health impacts of lead poisoning.

**Identification.** Children suffering from lead poisoning often fail to present outward symptoms. However, early clinical symptoms can include anemia, anorexia, abdominal pain and constipation. Lead is a neuro-toxin, and exposure can result in violent and aggressive behaviors, lead to learning disorders, may cause Attention Deficit Hyperactivity Disorder (ADHD) and has been known to reduce IQ by as many as 5-8 points with levels as low as 10 ug/dL. Lead is metabolized through the gastrointestinal system similar to iron and calcium, with uptake rates depending on the size and weight of the child. The blood half-life of lead is short (approximately 1 month) but the bone half-life can extend into decades.

Due to multiple risk factors facing many residents in the City of Flint (including aging housing conditions and water quality), we recommend that all children under age 6 living in the City of Flint or living in homes that use Flint water, attending school or childcare in Flint, or who spend time with a caregiver in the City of Flint, receive a blood lead test. Blood lead testing should be done through a child's primary care doctor to ensure adequate short-term and long-term follow-up. ***Families should be encouraged to have their children tested immediately either at their doctor's office or the Genesee County Health Department.***

**Management of Blood Lead Levels.** The following guidance is provided for management of childhood blood lead levels:

- **BLL < 5 ug/dL**
  - A lead level of less than 5 mcg/dL is not typically cause for concern.
  - Provide education and anticipatory guidance to ensure that lead levels do not rise.
  - Consider retesting in 12 months based on risk factors or concerns.

- **BLL >5 ug/dL**
  - **Children with capillary results of 5 ug/dL and higher must have a confirmatory venous blood draw.**
  - Families should receive anticipatory guidance, nutrition counseling, instruction on safe cleaning techniques and appropriate follow-up care from their primary care provider.
  - In-home services including case management and environmental investigations are available for all children with lead levels greater than 5 ug/dL. Refer patients to the Genesee County Health Department for this service.
  - Children with confirmed venous testing results greater than 5ug/dL within the past 18 months must be retested based on Medicaid policy and AAP guidelines. (See attached “Provider Quick Reference). If a child has not been retested within these timeframes, retesting is recommended as soon as possible.
- **BLL > 44 ug/dL.**
  - **Children with capillary results of 5 ug/dL and higher must have a confirmatory venous blood draw.**
  - Lead levels over 44 ug/dL may require hospitalization. Consult with an expert at the Children’s Hospital of Michigan in Detroit for additional guidance.
  - Families should receive anticipatory guidance, nutrition counseling, instruction on safe cleaning techniques and appropriate follow-up care from their primary care provider.
  - In-home services including case management and environmental investigations are available for all children with lead levels greater than 5 ug/dL. Refer patients to the Genesee County Health Department for this service.
  - Children with confirmed venous testing results greater than 5ug/dL within the past 18 months must be retested based on Medicaid policy and AAP guidelines. (See attached “Provider Quick Reference). If a child has not been retested within these timeframes, retesting is recommended as soon as possible.

**Reminder: All children covered by Medicaid must be tested at age 1 and 2.**

**Follow-up Care.** As providers, there are steps you can take to help support your families:

1. Continue to inform and educate families regarding lead risks and preventative steps that they can take to minimize their risks.
2. Encourage your families to use filtered water for drinking, mixing formula and washing dishes. Families can contact 2-1-1 for information on free NSF Certified water filters.
3. Healthy nutrition is critical for lead-exposed children. Make sure your patients are consuming balanced diets high in iron, calcium and Vitamin C. If you have concerns about their nutrition, consider recommending a multivitamin with iron. WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the Genesee County WIC office at (810) 237-4537 to learn more. In addition, SNAP offers a Double Bucks program that can provide healthy foods for less.
4. Breastfeeding is highly protective and encouraged. However, if the mother’s blood lead level rises above 40ug/dL or her level is greater than 20 ug/dL and the baby has a level above 5 ug/dL breastfeeding is not recommended.

5. Because lead is a neuro-toxin, children with lead poisoning need longitudinal follow-up and may require developmental and behavioral health intervention services. Continue monitoring your patients' development at every visit.
6. Consider additional wrap-around and support services that will benefit your patients such as early childhood home visiting programs, early head start and head start. Call 2-1-1 for more information.

**Local Resources.** Several local resources are available to you and your patients:

- Blood Testing. Patients are encouraged to contact their primary care provider for testing. The Genesee County Health Department also administers lead tests. Patients in need of transportation should contact 2-1-1 for assistance.
- Water Testing. Water testing is free through the City of Flint Water Testing Plant. Patients can call 810-787-6537 to learn more.
- WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the Genesee County WIC office at (810) 237-4537 to learn more.
- Child Development. If you have concerns about a child's growth, development or learning contact 2-1-1 for a Home Visiting Program in your area.

**Websites and contact information.**

**To:** Valacak, Mark  
**Subject:** Re: Breast feeding and maternal lead exposure

Well said, Mark!

Sent from my iPhone

On Oct 30, 2015, at 1:53 PM, Valacak, Mark <[MVALACAK@gchd.us](mailto:MVALACAK@gchd.us)> wrote:

In adults when we see high levels it is generally an occupational exposure and inhalation of lead fumes in industrial exposure settings like battery manufacturing, lead smelting, and stained lead glass.

A couple of factors are important to remember when we are talking about lead exposure in adults versus children. Absorption rates from gastrointestinal exposure are lower in adults versus children. So where a toddler might absorb about 50%, absorption rates decline in adults to 3-10%. About 90% of lead will end up in the bone where it mimics calcium. It causes less harm there than if it went to soft tissues like the liver or kidneys. The problem is that under circumstances that cause calcium mobilization, lead stored in the bone may remobilize and circulate in the blood, elevating blood lead levels. The mobilization of stored lead with pregnancy, menopause, and aging is a cause for concern. So to help mitigate that there should be an emphasis on good nutrition and a calcium rich diet. Pregnant and breastfeeding woman should be sure to take their vitamins to minimize calcium mobilization from the bones.

Reinforcing these messages would help minimize exposure.

**Subject:** Re: Breast feeding and maternal lead exposure

Looping in our toxicologist, as we have discussed this. Note that anyone should be using filtered or bottled water now, so that the issue of which house and which risk should already be addressed. Also- we do not have any data supporting adults with blood lead levels that high ( Off top of my head) and none have been in the 40's or higher since Long before April 2014.

Regardless, Linda and I had talked about breastfeeding moms... She can help.

Eden

Thank you for your quick answer!

This makes sense for pregnant moms, as there is no choice as to how the baby will get its nourishment. However, for breastfeeding moms in households in which filters will be provided, **do we know that breast milk (with possible higher maternal BLLs secondary to bone release from chronic exposure) is preferable to filtered tap water?** Does anybody know what the range of breast milk lead levels are in women who have BLLs around 30 or 35? In the data that Dr. Reynolds and I looked at (previously attached) the BLLs didn't go that high, and it said that the breast milk levels fluctuated.

In the Ettinger paper the highest maternal BLL with a breast milk sample was 29.9 (Table 1), which is less than the level of 40 recommended in the MDHHS handout. The article said that "Breast milk lead expressed as percentage of maternal blood lead ranged from 0.4 to 9.2% (mean = 1.6%, SD = 1.2%)" – p 929. The means a less an issue than the outliers, considering some of the extremely high water lead levels that have been found in the city and also the difficulty of predicting which houses might be most at risk.

I'm not sure if there is other, better data out there that might shed some light on this? Also, your attached pamphlet does deflect patients back to their doctors, but I'm not sure that those of us in the GCMS feel that we have adequate information to advise people further.

Laura

**Cc:** 'Lawrence Reynolds'; '[REDACTED] PPI [REDACTED]'; Peter Levine; Mark Valacak  
**Subject:** RE: Breast feeding and maternal lead exposure

Good morning,

Note that MDHHS/GCHD is about to send out (by emails and hopefully you all can disseminate at will to your colleagues?) a provider letter with provider resources, which will also all be on the webpage we are using. Parent letters with resources for them will be going out in hard copy through schools and daycares---all of this will be occurring in the next couple of days. Note that there is already a flyer on the [Michigan.gov/flintwater](http://Michigan.gov/flintwater) webpage for pregnant moms and breastfeeding---note that,

like all others including children, treatment only occurs for levels over 45, but removing lead from any environmental sources is important at all times.

We have already gotten information regarding pregnancy and lead levels from CDC: (Mary Jean Brown): "Pregnant women who work with lead should be tested (occupational, hobby, shooting ranges, renovation exposures). Worried women who want to be tested should not be refused but if their only exposure is the water the only intervention is to stop drinking the water from the river and it is my understanding that that has been accomplished. There is no medical treatment for pregnant women (chelation therapy) in the first trimester because of teratogenic concerns. At blood lead levels  $\geq 45$  in later trimesters, chelation may be considered to protect the fetus but should only be done in consultation with someone familiar with chelation in early childhood and high risk pregnancies. A general alert to area OB/Gyn's and maternity clinics that patients should not drink water from the river, would be advisable."

**Subject:** Breast feeding and maternal lead exposure

Dear Eden,

Our county medical society is in the process of drafting a "fact sheet" specifically for our physician members to try and help them help their patients. We are endeavoring to keep the content consistent with the other messaging going out, but to use as many channels as we can, and to make this very easy for physicians to digest (i.e. brief and pertinent to their patients). I am attaching our draft to this email, as well as some of the articles that we have found.

One of the questions that came up is what to tell lead-exposed mothers who are pregnant or breastfeeding. We have pulled a number of articles that talk about lower maternal BLLs, but these are usually in the context of lower lead levels in drinking water. We are not sure if these recommendations still hold in our situation: the water is variable, the mothers are not routinely tested (should they be?), and lead is released from maternal bone for a long time. We also read that the lead levels fluctuate. All of this is to say, we are not certain that breastfeeding is safer than using filtered water in our situation (though it pains us as pediatricians and family docs to suggest this) and also, what the safe BLL is for a mother? The MDHHS recommendation of 40 in the

recent Lead Week Toolkits seemed high, considering the fluctuating BLL and bone storage.

You had previously asked your toxicologist about the copper levels for us, and I was hoping you might pose this question to them as well.

Thank you for your help!

Laura Carravallah, MD

# CHILDHOOD LEAD POISONING

## Blood Lead Level (BLL) Quick Reference for Primary Care Providers

### Not Yet Tested

Consider screening ALL children between ages 1-6

Need for testing can be based on risk factors

REMINDER: Medicaid requires all children to be tested at ages 1 & 2. Children who were not tested between 1 & 2 must be tested at least once between 3 & 6.

### BLL <5

Review lead levels with family

Provide anticipatory guidance

REMINDER: Medicaid requires all children to be tested at ages 1 & 2. Children who were not tested between 1 & 2 must be tested at least once between 3 & 6.

### BLL 5-14

Review lead levels with family

Confirm results with venous blood sample

Review venous sample with family

Perform environmental history. Consider other children who may be exposed

Consider iron sufficiency, provide nutritional counseling r/t calcium and iron

Provide anticipatory guidance

Refer to case management

**FOLLOW UP:** Retest venous sample within 1-3 months to ensure BLL is not rising

REMINDER: Medicaid requires all children to be tested at ages 1 & 2. Children who were not tested between 1 & 2 must be tested at least once between 3 & 6.

### BLL 15-44

Review lead levels with family

Confirm results with venous blood sample

Perform environmental history. Consider other children who may be exposed

Consider if a specific evaluation of the child is necessary such as an abdominal x-ray. Gut decontamination may be needed if leaded foreign bodies are visualized in x-ray

Consider iron sufficiency, provide nutritional counseling r/t calcium and iron

Refer to case management

**FOLLOW UP:** Retest venous sample monthly until levels are <15, repeat every 1-3 months until levels are <5

REMINDER: Medicaid requires all children to be tested at ages 1 & 2. Children who were not tested between 1 & 2 must be tested at least once between 3 & 6.

### BLL >44

Review lead levels with family

Confirm results with venous blood sample

Review venous sample with family

Any treatment at this level should be performed in consultation with an expert at Children's Hospital of Michigan in Detroit.

**FOLLOW UP:** As directed by expert. Monthly venous samples will be required.

REMINDER: Medicaid requires all children to be tested at ages 1 & 2. Children who were not tested between 1 & 2 must be tested at least once between 3 & 6.

# PREGNANT AND NURSING MOTHERS

## WHAT YOU NEED TO KNOW ABOUT LEAD POISONING

### What causes lead poisoning?

There are many factors that can put a pregnant woman or nursing mother at risk for lead poisoning.

In Michigan, lead paint is still the #1 cause of lead poisoning. It is often found in homes built before 1978 and the older the home, the more likely that painted surfaces like windows, cupboards, doors and porches will contain lead paint.

Other sources of exposure may include soil and water or jobs and hobbies using lead such as factory work, soldering, ammunitions or jewelry making. Some pottery glazes, imported spices and home remedies may also contain lead.

### Should I get tested?

Routine blood testing is NOT recommended for all pregnant women or nursing mothers. Talk to your doctor or local health department to learn more.

**If I test positive for lead poisoning can I continue to breastfeed?**

In most cases, breastfeeding is safe. However, if your blood lead level goes above 40 ug/dl or your level is greater than 20 ug/dl and your baby has a level above 5 ug/dl, you should talk with your doctor about continuing to breastfeed.

### What can I do to protect myself from lead?

- Wash hands, bottles, pacifiers and toys often.
- Always take off shoes before going into the house.
- Flush your pipes before drinking, and only use cold water for drinking or mixing formula. Flush pipes by running the water for approximately 5 minutes.
- Watch your diet carefully. Foods high in calcium and iron help keep lead from being absorbed by your body.
- Avoid using power sanders, open-flame torches, heat guns, dry scrapers and dry sandpaper on painted surfaces.
- Fix peeling or chipping paint.
- Use a certified Repair and Remodeling Professional when making updates to your home.
- Practice safe cleaning methods.

To learn more about lead poisoning prevention and blood lead testing, call:

**(888) 322-4453**

**This Document is a Non-Responsive Attachment.**

# IS YOUR CHILD SAFE FROM LEAD POISONING?

## LEARN HOW TO PROTECT YOUR FAMILY: CREATE A LEAD SAFE HOME

### What causes lead poisoning?

There are many places in a home that can put babies and children in danger of lead poisoning.

Lead paint is the #1 cause of lead poisoning in Michigan and is often found in homes built before 1978. The older the home, the more likely that painted surfaces like windows, cupboards, doors and porches will contain lead paint.

Lead poisoning occurs most often when children come in contact with lead in the air, in dust and in lead paint. Lead can also be found in soil, drinking water if supplied by lead pipes, certain home remedies and is used in some hobbies and occupations.

Exposure to lead is a serious health threat. Carefully consider where your child spends time (childcare, relatives, your home) when thinking about lead poisoning hazards.

### How can I tell if my child has lead poisoning?

Talk to your doctor about testing your child's blood for lead poisoning.

#### When should my child be tested for lead poisoning?

Children should be tested at one and two years of age or if you think your child has been exposed to a lead.

To learn more about lead poisoning prevention and blood lead testing, call the Childhood Lead Poisoning Prevention Project:

**(517) 335-8885**

**(888) 322-4453**

### Take this quiz to see if your child may have lead poisoning:

Symptoms of lead poisoning can be silent—and hard to recognize. Preventing lead poisoning before it happens is the best way to keep your family safe. Take this quiz to see if your child may be at risk:

Does your child currently live in a home built before 1950 or have they lived in a home built before 1950 in the recent past? Do they spend time at or often visit a home built before 1950?

Yes No Don't know

Does your child currently live in a home built before 1978 that was recently remodeled? Have they lived in or often visited a home built before 1978 that was recently remodeled?

Yes No Don't know

Does your child have a brother, sister or playmate with lead poisoning?

Yes No Don't know

Does your child live with an adult whose job or hobby involves lead?

Yes No Don't know

Do you or your child's caregiver use home remedies that may contain lead?

Yes No Don't know

If you answered NO to all of these questions, your child is probably not at risk for lead poisoning.

If you answered YES or DON'T KNOW to any of these questions, talk to your doctor about testing your child for lead poisoning.

# MAKE EVERY DAY LEAD SAFE

**Safe Cleaning.** Use these steps to help keep your home clean and reduce your child's risk of exposure. Use these tips to clean your windows, doors, floors, porches, stairs and child play areas.

**Put on rubber gloves.** If you do not have rubber gloves, wash your hands well after cleaning.

**Use the right cleaners and supplies you can throw away.** Use soapy cleaners or products made to remove lead dust.

**Remove paint chips first.** Window areas and porches often have peeling paint and lead dust. Pick up paint chips you can see and throw them away in a plastic bag.

**Always wet-mop floors and window sills.** Do not broom lead dust. Throw away cloths after wiping each area. Replace mop water frequently.

**Don't use a vacuum unless it is a HEPA vacuum.** A regular vacuum will spread lead dust into the air you breathe. Some health departments have HEPA vacuums available to borrow.

**Rinse after cleaning.** Use clean water and a new mop head or fresh paper towels to wipe away suds.

**Always empty wash water down a toilet.**

**Repeat these steps weekly,** or when dirt and dust appear on floors, porches, window wells, window sills, stairs and children's play areas.

## For Homes with Lead Pipes

**If you use a water filter,** be sure it meets NSF/ANSI 53 standards for lead reduction.

✓ **Flush your pipes before drinking,** and only use cold water for cooking and mixing formula. Flush pipes by running the water for approximately 5 minutes.

✓ **Test.** Consider contacting your local water authority to have your water tested.

## Daily Lead Safe Practices

- Wash hands, bottles, pacifiers and toys often.
- Always take off shoes before going into the house.
- Watch your child's diet. Foods high in calcium and iron help keep lead from being absorbed by a child's body.
- Avoid using power sanders, open-flame torches, heat guns, dry scrapers and dry sandpaper or heat guns on painted surfaces.
- Paint over peeling or chipping paint.
- Use a certified Repair and Remodeling Professional when making updates to your home.
- Always use the safe cleaning methods listed above.

Thinking about remodeling your home? Need advice about identifying and removing lead paint? Call the Lead and Healthy Homes Section: 866-691-LEAD.

**This Document is a Non-Responsive Attachment.**

# Help Fight Lead Poisoning with a Healthy Diet

## Regularly Eat Healthy Foods

Children with empty stomachs absorb more lead than children with full stomachs.

Provide your child with four to six small meals during the day. The following nutrients can help protect your child from lead poisoning:

### Iron-Rich Foods

Normal levels of iron work to protect the body from the harmful effects of lead. Good sources of dietary iron include:

Lean red meats, fish, and chicken  
Iron-fortified cereals  
Dried fruits (raisins, prunes)

### Calcium-Rich Foods

Calcium reduces lead absorption and also helps make teeth and bones strong. Good sources of dietary calcium include:

Milk  
Yogurt  
Cheese  
Green leafy vegetables (spinach, kale, collard greens)

### Vitamin C-Rich Foods

Vitamin C and iron-rich foods work together to reduce lead absorption. Good sources of vitamin C include:

Oranges, orange juice  
Grapefruits, grapefruit juice  
Tomatoes, tomato juice  
Green peppers

# Simple Steps You Can Take

## to Protect Your Family from Lead Hazards

---

### If you think your home has high levels of lead:

- Make sure your children eat healthy, low-fat foods high in iron, calcium, and vitamin C.
- Get your children tested for lead, even if they seem healthy.
- Get your home tested for lead if it was built before 1978. Call 1-800-424-LEAD for more information.
- Always wash your hands before eating.
- Wash children's hands, bottles, pacifiers, and toys.
- Do not use imported pottery to store or serve food.
- Let tap water run for one minute before using.
- Use only cold water for making your baby's formula, drinking, and cooking.
- Regularly clean floors, windowsills, and other surfaces using wet methods that control dust.
- Wipe or remove shoes before entering your house.
- If you rent, it is your landlord's job to keep paint in good shape. Report peeling or chipping paint to your landlord and call your health department if the paint is not repaired safely.
- Take precautions to avoid exposure to lead dust when remodeling or renovating.
- Don't try to remove paint yourself!

---

# Frequently Asked Questions About Lead in Flint Water

- Lead is hard to avoid completely. It can be found in old paint, water pipes and brass water faucets, in dirt, at some job sites, and in metal used for some hobbies.
- The amount of lead found in some Flint homes' drinking water could affect kids' health.
  - Even small amounts of lead can harm kids' health because they are little and still growing.
  - Adults are less likely to be harmed by the levels found in the water.
- Filter your drinking water using a NSF-approved filter.
  - Find a NSF-approved filter at [http://www.gchd.us/docs/lead\\_filter\\_information.pdf](http://www.gchd.us/docs/lead_filter_information.pdf).
  - If you use City of Flint water, you can call 211 to find out where you can pick up a free water filter.
- Some filters can remove up to 99% of the lead in water when used properly. To be sure your filter is removing as much lead as it can, carefully follow the instructions that came with it.
  - Change the filter cartridge as often as you should.
  - Run only cold water through the filter.
- Even after changes to the water system, it may take a while before lead levels in your home's water drop. Use the tips below to know when it's best to use filtered water:

## Lead in Water

Although your water may be a different color sometimes, it is not caused by lead. It's important to remember:

- You can't see, smell, or taste lead in water.
- Lead won't change the color of your water.
- The only way to know what your home's lead levels are is by having your water tested in a lab.

Please call the Flint Water Department at 810-787-6537 to request a free or low-cost water test.

## In The Kitchen

Use filtered tap water for:

- Drinking (including making coffee, drink mixes, juice, baby formula)
- Cooking (even if you boil the water, the lead will stay in the water and food)
- Washing fruits and vegetables

You can use unfiltered tap water for:

- Washing your hands
- Washing dishes
- Wiping down countertops

## Cleaning

You can use unfiltered tap water for:

- Mopping floors
- Washing clothes

Your washing machine and dryer won't put lead from the water into the air of your home.

## In the Bathroom

Use filtered tap water for:

- Brushing kids' teeth

You can use unfiltered tap water for:

- Showers
- Baths (don't let kids drink the water as they play in the tub)
- Brushing your teeth (if you are an adult)

Lead will not cause rashes or other skin problems. However, if chlorine levels or other cleaners are high in the water, it may cause itchy or dry skin (similar to what can happen when you swim in a pool).

## Caring for Pets

Use filtered tap water for:

- Pets' water bowls

You can use unfiltered tap water for:

- Baths

If you notice your pet acting differently than normal, please contact your vet.

## Other Sources of Lead in Your Home

### Lead Paint

- Homes built before 1978 likely have lead paint, both inside and outside.
- Old paint is the most common way that kids are exposed to lead.

### Dirt

- If you live in the city, there may be lead in the dirt outside your home.
- Before 1996, gas and the exhaust from cars contained lead. More lead will be found in dirt in busy traffic areas.

### Dust

- The dust in your home can contain tiny amounts of both the paint and the dirt that contain lead.

### Hobbies & Jobs

- Solder, fishing sinkers, bullets, and stained glass framing materials are some of the items in your home that may contain lead. You could also track home lead dust from your job site.

## Have Questions?

For more information about protecting yourself and your family from lead, please visit:

[www.michigan.gov/lead](http://www.michigan.gov/lead)

Or you can call the Michigan Department of Health and Human Services at:

**1-800-648-6942**

The staff at this number will help direct you to the best department that can answer your questions about lead in your home.

To request a free or low-cost water test, please call the Flint Water Department at:

**1-810-787-6537**

To find out if you can get a free water filter, please call 211.

**This Document is a Non-Responsive Attachment.**

October 30, 2015

Dear Provider:

As you may be aware from recent news reports, elevated levels of lead have been found in lead pipes within the City of Flint's water system.

To help protect the children of Flint from the current lead in water exposure, the Genesee County Health Department and Michigan Department of Health and Human Services are contacting you to assist you in providing guidance to support your families.

Children can be exposed to lead from drinking water in that runs through lead pipes, old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass and jewelry making, and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found.

As a primary care provider, you play a critical role in helping to ensure that children and families exposed to lead receive the care and reassurances they need to manage the potential health impacts of lead poisoning.

**Identification.** Children suffering from lead poisoning often fail to present outward symptoms. However, early clinical symptoms can include anemia, anorexia, abdominal pain and constipation. Lead is a neuro-toxin, and exposure can result in violent and aggressive behaviors, lead to learning disorders, may cause Attention Deficit Hyperactivity Disorder (ADHD) and has been known to reduce IQ by as many as 5-8 points with levels as low as 10 ug/dL. Lead is metabolized through the gastrointestinal system similar to iron and calcium, with uptake rates depending on the size and weight of the child. The blood half-life of lead is short (approximately 1 month) but the bone half-life can extend into decades.

Due to multiple risk factors facing many residents in the City of Flint (including aging housing conditions and water quality), we recommend that all children under age 6 living in the City of Flint or living in homes that use Flint water, attending school or childcare in Flint, or who spend time with a caregiver in the City of Flint, receive a blood lead test. Blood lead testing should be done through a child's primary care doctor to ensure adequate short-term and long-term follow-up. **Families should be encouraged to have their children tested immediately *either at their doctor's office or the Genesee County Health Department.***

**Management of Blood Lead Levels.** The following guidance is provided for management of childhood blood lead levels:

- **BLL < 5 ug/dL**
  - A lead level of less than 5 mcg/dL is not typically cause for concern.
  - Provide education and anticipatory guidance to ensure that lead levels do not rise.
  - Consider retesting in 12 months based on risk factors or concerns.

- **BLL >5 ug/dL**
  - **Children with capillary results of 5 ug/dL and higher must have a confirmatory venous blood draw.**
  - Families should receive anticipatory guidance, nutrition counseling, instruction on safe cleaning techniques and appropriate follow-up care from their primary care provider.
  - In-home services including case management and environmental investigations are available for all children with lead levels greater than 5 ug/dL. Refer patients to the Genesee County Health Department for this service.
  - Children with confirmed venous testing results greater than 5ug/dL within the past 18 months must be retested based on Medicaid policy and AAP guidelines. (See attached “Provider Quick Reference). If a child has not been retested within these timeframes, retesting is recommended as soon as possible.
- **BLL > 44 ug/dL.**
  - **Children with capillary results of 5 ug/dL and higher must have a confirmatory venous blood draw.**
  - Lead levels over 44 ug/dL may require hospitalization. Consult with an expert at the Children’s Hospital of Michigan in Detroit for additional guidance.
  - Families should receive anticipatory guidance, nutrition counseling, instruction on safe cleaning techniques and appropriate follow-up care from their primary care provider.
  - In-home services including case management and environmental investigations are available for all children with lead levels greater than 5 ug/dL. Refer patients to the Genesee County Health Department for this service.
  - Children with confirmed venous testing results greater than 5ug/dL within the past 18 months must be retested based on Medicaid policy and AAP guidelines. (See attached “Provider Quick Reference). If a child has not been retested within these timeframes, retesting is recommended as soon as possible.

**Reminder: All children covered by Medicaid must be tested at age 1 and 2.**

**Follow-up Care.** As providers, there are steps you can take to help support your families:

1. Continue to inform and educate families regarding lead risks and preventative steps that they can take to minimize their risks.
2. Encourage your families to use filtered water for drinking, mixing formula and washing dishes. Families can contact 2-1-1 for information on free NSF Certified water filters.
3. Healthy nutrition is critical for lead-exposed children. Make sure your patients are consuming balanced diets high in iron, calcium and Vitamin C. If you have concerns about their nutrition, consider recommending a multivitamin with iron. WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the Genesee County WIC office at (810) 237-4537 to learn more. In addition, SNAP offers a Double Bucks program that can provide healthy foods for less.
4. Breastfeeding is highly protective and encouraged. However, if the mother’s blood lead level rises above 40ug/dL or her level is greater than 20 ug/dL and the baby has a level above 5 ug/dL breastfeeding is not recommended.

5. Because lead is a neuro-toxin, children with lead poisoning need longitudinal follow-up and may require developmental and behavioral health intervention services. Continue monitoring your patients' development at every visit.
6. Consider additional wrap-around and support services that will benefit your patients such as early childhood home visiting programs, early head start and head start. Call 2-1-1 for more information.

**Local Resources.** Several local resources are available to you and your patients:

- Blood Testing. Patients are encouraged to contact their primary care provider for testing. The Genesee County Health Department also administers lead tests. Patients in need of transportation should contact 2-1-1 for assistance.
- Water Testing. Water testing is free through the City of Flint Water Testing Plant. Patients can call 810-787-6537 to learn more.
- WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the Genesee County WIC office at (810) 237-4537 to learn more.
- Child Development. If you have concerns about a child's growth, development or learning contact 2-1-1 for a Home Visiting Program in your area.

October 27, 2015

Dear Parent,

To help make sure the children of Flint are safe from lead exposure, the Genesee County Health Department and the Michigan Department of Health and Human Services are providing answers to the following questions:

- Where does lead come from?
- What can I do to protect my family?
- Should I get my child tested for lead?
- Where can I find more information about lead?

### **Where does lead come from?**

Elevated levels of lead have been found in the drinking water from lead pipes in the City of Flint. Kids can also be exposed to lead from old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass, jewelry making and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found. Lead is a serious health hazard, especially for small children who become lead poisoned when they eat, drink or breathe lead.

**Should my child get a blood lead test?** Children who live in the City of Flint, live in a home using City of Flint water, or who attend school, childcare or often spend time with a caregiver in the City of Flint should be tested for lead poisoning.

*This should be done as soon as possible.*

### **Where should I go to get a blood lead test for my child?**

The best place to get your child's blood lead test is your doctor's office. Tests are covered by most health plans. Your doctor will follow up with you on lab tests and provide you with information on what to do next. Your child can also get a free lead test at the Genesee County Health Department. If you need transportation, contact 2-1-1 for help.

### **Understanding your child's lead test result.**

**A lead level below 5** means there is a little lead in your child's blood. Use the tips below to help keep your child safe. Your doctor may suggest retesting your child within the next 12 months to make sure the level does not go up.

**A lead level of 5-44** means that your child has had some exposure to lead. Work with your doctor and local health department for further guidance on how to limit your lead exposure. Your doctor may retest your child in 1-3 months to make sure the level does not go up.

Children with very high levels of lead (**over 44**) may require treatment at the hospital.

### **What Can I Do to Keep My Family Safe?**

The following steps should be taken right away to help protect you and your child.

### **Protecting your family from lead in the water:**

- Get your water tested for lead. It's free. Call (810) 787-6537 to learn more.
- Use a water filter in your home. Call 2-1-1 for information on free NSF Certified water filters.
- Run only cold water through the filter.
- If you do not have a water filter, use bottled water for drinking and mixing formula.
- Use filtered or bottled water for drinking (including making coffee, drink mixes, juice, baby formula), and cooking (even if you boil the water, the lead will stay in the water and food).
- You can use unfiltered tap water for washing your hands and washing dishes.
- If you have to use unfiltered water for drinking or cooking, run the tap for five minutes before using the water.

### **Safe cleaning:**

Safe cleaning is important. Keeping your home clean and safe from lead hazards will help to protect your family.

- Buildings built before 1978 could have lead paint in them. Use wet paper towels to clean up paint chips and dust in these older buildings. Be sure to clean around windows, play areas, and floors.
- Wash hands and toys often with soap and water.
- You can use unfiltered tap water to wipe down countertops, mop floors, and wash clothes.

### **Good nutrition:**

Some foods will help keep lead from being stored in a child's body. These are foods with a lot of calcium, iron and vitamin C. These foods include:

<b>Calcium Rich Foods</b>	<b>Iron Rich Foods</b>	<b>Foods with Vitamin C</b>
➤ Milk	➤ Beans	➤ Oranges
➤ Cheese	➤ Lean meats like fish and chicken	➤ Orange juice
➤ Yogurt	➤ Whole grain cereals	➤ Grapefruits
➤ Tofu	➤ Peanut butter	➤ Tomatoes
➤ Spinach		➤ Green peppers

Always wash your fruits with filtered water. If you are concerned about your child's diet, talk with your doctor who may also recommend a daily multivitamin.

WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the **Genesee County WIC office at (810) 237-4537** to learn more. SNAP also offers a Double Bucks program to purchase even more healthy food for no additional costs.

**Where can I get more information on lead?**

- Genesee County Health Department Lead Program  
(810) 257-3833  
[www.gchd.us](http://www.gchd.us)
- Michigan Department of Health and Human Services  
Childhood Lead Poisoning Prevention Program  
(888) 322-4453  
[www.michigan.gov/lead](http://www.michigan.gov/lead)
- United States Environmental Protection Agency  
[www.epa.gov/lead](http://www.epa.gov/lead)
- U.S. Centers for Disease Control and Prevention (CDC) Web site  
[www.cdc.gov/nceh/lead](http://www.cdc.gov/nceh/lead)

These recommendations will stay in effect until the Genesee County Health Department lifts the restrictions on water usage.

Sincerely,

Eden V. Wells, MD, MPH, FACPM  
Chief Medical Executive  
Michigan Department of Health and Human Services

Gary K. Johnson, MD, MPH  
Medical Director  
Genesee County Health Department

# IS YOUR CHILD SAFE FROM LEAD POISONING?

## LEARN HOW TO PROTECT YOUR FAMILY: CREATE A LEAD SAFE HOME

### What causes lead poisoning?

There are many places in a home that can put babies and children in danger of lead poisoning.

Lead paint is the #1 cause of lead poisoning in Michigan and is often found in homes built before 1978. The older the home, the more likely that painted surfaces like windows, cupboards, doors and porches will contain lead paint.

Lead poisoning occurs most often when children come in contact with lead in the air, in dust and in lead paint. Lead can also be found in soil, drinking water if supplied by lead pipes, certain home remedies and is used in some hobbies and occupations.

Exposure to lead is a serious health threat. Carefully consider where your child spends time (childcare, relatives, your home) when thinking about lead poisoning hazards.

### How can I tell if my child has lead poisoning?

Talk to your doctor about testing your child's blood for lead poisoning.

#### When should my child be tested for lead poisoning?

Children should be tested at one and two years of age or if you think your child has been exposed to a lead.

To learn more about lead poisoning prevention and blood lead testing, call the Childhood Lead Poisoning Prevention Project:

**(517) 335-8885**

**(888) 322-4453**

### Take this quiz to see if your child may have lead poisoning:

Symptoms of lead poisoning can be silent—and hard to recognize. Preventing lead poisoning before it happens is the best way to keep your family safe. Take this quiz to see if your child may be at risk:

Does your child currently live in a home built before 1950 or have they lived in a home built before 1950 in the recent past? Do they spend time at or often visit a home built before 1950?

Yes No Don't know

Does your child currently live in a home built before 1978 that was recently remodeled? Have they lived in or often visited a home built before 1978 that was recently remodeled?

Yes No Don't know

Does your child have a brother, sister or playmate with lead poisoning?

Yes No Don't know

Does your child live with an adult whose job or hobby involves lead?

Yes No Don't know

Do you or your child's caregiver use home remedies that may contain lead?

Yes No Don't know

If you answered NO to all of these questions, your child is probably not at risk for lead poisoning.

If you answered YES or DON'T KNOW to any of these questions, talk to your doctor about testing your child for lead poisoning.

# MAKE EVERY DAY LEAD SAFE

**Safe Cleaning.** Use these steps to help keep your home clean and reduce your child's risk of exposure. Use these tips to clean your windows, doors, floors, porches, stairs and child play areas.

**Put on rubber gloves.** If you do not have rubber gloves, wash your hands well after cleaning.

**Use the right cleaners and supplies you can throw away.** Use soapy cleaners or products made to remove lead dust.

**Remove paint chips first.** Window areas and porches often have peeling paint and lead dust. Pick up paint chips you can see and throw them away in a plastic bag.

**Always wet-mop floors and window sills.** Do not broom lead dust. Throw away cloths after wiping each area. Replace mop water frequently.

**Don't use a vacuum unless it is a HEPA vacuum.** A regular vacuum will spread lead dust into the air you breathe. Some health departments have HEPA vacuums available to borrow.

**Rinse after cleaning.** Use clean water and a new mop head or fresh paper towels to wipe away suds.

**Always empty wash water down a toilet.**

**Repeat these steps weekly,** or when dirt and dust appear on floors, porches, window wells, window sills, stairs and children's play areas.

## For Homes with Lead Pipes

**If you use a water filter,** be sure it meets NSF/ANSI 53 standards for lead reduction.

✓ **Flush your pipes before drinking,** and only use cold water for cooking and mixing formula. Flush pipes by running the water for approximately 5 minutes.

✓ **Test.** Consider contacting your local water authority to have your water tested.

## Daily Lead Safe Practices

- Wash hands, bottles, pacifiers and toys often.
- Always take off shoes before going into the house.
- Watch your child's diet. Foods high in calcium and iron help keep lead from being absorbed by a child's body.
- Avoid using power sanders, open-flame torches, heat guns, dry scrapers and dry sandpaper or heat guns on painted surfaces.
- Paint over peeling or chipping paint.
- Use a certified Repair and Remodeling Professional when making updates to your home.
- Always use the safe cleaning methods listed above.

Thinking about remodeling your home? Need advice about identifying and removing lead paint? Call the Lead and Healthy Homes Section: 866-691-LEAD.

**This Document is a Non-Responsive Attachment.**

# Help Fight Lead Poisoning with a Healthy Diet

## Regularly Eat Healthy Foods

Children with empty stomachs absorb more lead than children with full stomachs.

Provide your child with four to six small meals during the day. The following nutrients can help protect your child from lead poisoning:

### Iron-Rich Foods

Normal levels of iron work to protect the body from the harmful effects of lead. Good sources of dietary iron include:

Lean red meats, fish, and chicken  
Iron-fortified cereals  
Dried fruits (raisins, prunes)

### Calcium-Rich Foods

Calcium reduces lead absorption and also helps make teeth and bones strong. Good sources of dietary calcium include:

Milk  
Yogurt  
Cheese  
Green leafy vegetables (spinach, kale, collard greens)

### Vitamin C-Rich Foods

Vitamin C and iron-rich foods work together to reduce lead absorption. Good sources of vitamin C include:

Oranges, orange juice  
Grapefruits, grapefruit juice  
Tomatoes, tomato juice  
Green peppers

# Simple Steps You Can Take

## to Protect Your Family from Lead Hazards

---

### If you think your home has high levels of lead:

- Make sure your children eat healthy, low-fat foods high in iron, calcium, and vitamin C.
- Get your children tested for lead, even if they seem healthy.
- Get your home tested for lead if it was built before 1978. Call 1-800-424-LEAD for more information.
- Always wash your hands before eating.
- Wash children's hands, bottles, pacifiers, and toys.
- Do not use imported pottery to store or serve food.
- Let tap water run for one minute before using.
- Use only cold water for making your baby's formula, drinking, and cooking.
- Regularly clean floors, windowsills, and other surfaces using wet methods that control dust.
- Wipe or remove shoes before entering your house.
- If you rent, it is your landlord's job to keep paint in good shape. Report peeling or chipping paint to your landlord and call your health department if the paint is not repaired safely.
- Take precautions to avoid exposure to lead dust when remodeling or renovating.
- Don't try to remove paint yourself!

---

# Frequently Asked Questions About Lead in Flint Water

- Lead is hard to avoid completely. It can be found in old paint, water pipes and brass water faucets, in dirt, at some job sites, and in metal used for some hobbies.
- The amount of lead found in some Flint homes' drinking water could affect kids' health.
  - Even small amounts of lead can harm kids' health because they are little and still growing.
  - Adults are less likely to be harmed by the levels found in the water.
- Filter your drinking water using a NSF-approved filter.
  - Find a NSF-approved filter at [http://www.gchd.us/docs/lead\\_filter\\_information.pdf](http://www.gchd.us/docs/lead_filter_information.pdf).
  - If you use City of Flint water, you can call 211 to find out where you can pick up a free water filter.
- Some filters can remove up to 99% of the lead in water when used properly. To be sure your filter is removing as much lead as it can, carefully follow the instructions that came with it.
  - Change the filter cartridge as often as you should.
  - Run only cold water through the filter.
- Even after changes to the water system, it may take a while before lead levels in your home's water drop. Use the tips below to know when it's best to use filtered water:

## Lead in Water

Although your water may be a different color sometimes, it is not caused by lead. It's important to remember:

- You can't see, smell, or taste lead in water.
- Lead won't change the color of your water.
- The only way to know what your home's lead levels are is by having your water tested in a lab.

Please call the Flint Water Department at 810-787-6537 to request a free or low-cost water test.

## In The Kitchen

Use filtered tap water for:

- Drinking (including making coffee, drink mixes, juice, baby formula)
- Cooking (even if you boil the water, the lead will stay in the water and food)
- Washing fruits and vegetables

You can use unfiltered tap water for:

- Washing your hands
- Washing dishes
- Wiping down countertops

## Cleaning

You can use unfiltered tap water for:

- Mopping floors
- Washing clothes

Your washing machine and dryer won't put lead from the water into the air of your home.

## In the Bathroom

Use filtered tap water for:

- Brushing kids' teeth

You can use unfiltered tap water for:

- Showers
- Baths (don't let kids drink the water as they play in the tub)
- Brushing your teeth (if you are an adult)

Lead will not cause rashes or other skin problems. However, if chlorine levels or other cleaners are high in the water, it may cause itchy or dry skin (similar to what can happen when you swim in a pool).

## Caring for Pets

Use filtered tap water for:

- Pets' water bowls

You can use unfiltered tap water for:

- Baths

If you notice your pet acting differently than normal, please contact your vet.

## Other Sources of Lead in Your Home

### Lead Paint

- Homes built before 1978 likely have lead paint, both inside and outside.
- Old paint is the most common way that kids are exposed to lead.

### Dirt

- If you live in the city, there may be lead in the dirt outside your home.
- Before 1996, gas and the exhaust from cars contained lead. More lead will be found in dirt in busy traffic areas.

### Dust

- The dust in your home can contain tiny amounts of both the paint and the dirt that contain lead.

### Hobbies & Jobs

- Solder, fishing sinkers, bullets, and stained glass framing materials are some of the items in your home that may contain lead. You could also track home lead dust from your job site.

## Have Questions?

For more information about protecting yourself and your family from lead, please visit:

[www.michigan.gov/lead](http://www.michigan.gov/lead)

Or you can call the Michigan Department of Health and Human Services at:

**1-800-648-6942**

The staff at this number will help direct you to the best department that can answer your questions about lead in your home.

To request a free or low-cost water test, please call the Flint Water Department at:

**1-810-787-6537**

To find out if you can get a free water filter, please call 211.

October 27, 2015

Dear Parent,

To help make sure the children of Flint are safe from lead exposure, the Genesee County Health Department and the Michigan Department of Health and Human Services are providing answers to the following questions:

- Where does lead come from?
- What can I do to protect my family?
- Should I get my child tested for lead?
- Where can I find more information about lead?

### **Where does lead come from?**

Elevated levels of lead have been found in the drinking water from lead pipes in the City of Flint. Kids can also be exposed to lead from old lead paint, soil, pottery, cosmetics and toys and some home remedies. Adult jobs and hobbies, like auto repair, stained glass, jewelry making and ammunitions handling can also put children at risk if they touch clothing or play in areas where lead is found. Lead is a serious health hazard, especially for small children who become lead poisoned when they eat, drink or breathe lead.

**Should my child get a blood lead test?** Children who live in the City of Flint, live in a home using City of Flint water, or who attend school, childcare or often spend time with a caregiver in the City of Flint should be tested for lead poisoning.

*This should be done as soon as possible.*

### **Where should I go to get a blood lead test for my child?**

The best place to get your child's blood lead test is your doctor's office. Tests are covered by most health plans. Your doctor will follow up with you on lab tests and provide you with information on what to do next. Your child can also get a free lead test at the Genesee County Health Department. If you need transportation, contact 2-1-1 for help.

### **Understanding your child's lead test result.**

**A lead level below 5** means there is a little lead in your child's blood. Use the tips below to help keep your child safe. Your doctor may suggest retesting your child within the next 12 months to make sure the level does not go up.

**A lead level of 5-44** means that your child has had some exposure to lead. Work with your doctor and local health department for further guidance on how to limit your lead exposure. Your doctor may retest your child in 1-3 months to make sure the level does not go up.

Children with very high levels of lead (**over 44**) may require treatment at the hospital.

### **What Can I Do to Keep My Family Safe?**

The following steps should be taken right away to help protect you and your child.

### **Protecting your family from lead in the water:**

- Get your water tested for lead. It's free. Call (810) 787-6537 to learn more.
- Use a water filter in your home. Call 2-1-1 for information on free NSF Certified water filters.
- Run only cold water through the filter.
- If you do not have a water filter, use bottled water for drinking and mixing formula.
- Use filtered or bottled water for drinking (including making coffee, drink mixes, juice, baby formula), and cooking (even if you boil the water, the lead will stay in the water and food).
- You can use unfiltered tap water for washing your hands and washing dishes.
- If you have to use unfiltered water for drinking or cooking, run the tap for five minutes before using the water.

### **Safe cleaning:**

Safe cleaning is important. Keeping your home clean and safe from lead hazards will help to protect your family.

- Buildings built before 1978 could have lead paint in them. Use wet paper towels to clean up paint chips and dust in these older buildings. Be sure to clean around windows, play areas, and floors.
- Wash hands and toys often with soap and water.
- You can use unfiltered tap water to wipe down countertops, mop floors, and wash clothes.

### **Good nutrition:**

Some foods will help keep lead from being stored in a child's body. These are foods with a lot of calcium, iron and vitamin C. These foods include:

<b>Calcium Rich Foods</b>	<b>Iron Rich Foods</b>	<b>Foods with Vitamin C</b>
➤ Milk	➤ Beans	➤ Oranges
➤ Cheese	➤ Lean meats like fish and chicken	➤ Orange juice
➤ Yogurt	➤ Whole grain cereals	➤ Grapefruits
➤ Tofu	➤ Peanut butter	➤ Tomatoes
➤ Spinach		➤ Green peppers

Always wash your fruits with filtered water. If you are concerned about your child's diet, talk with your doctor who may also recommend a daily multivitamin.

WIC and SNAP provide assistance to parents and children who need fresh and healthy foods. Contact the **Genesee County WIC office at (810) 237-4537** to learn more. SNAP also offers a Double Bucks program to purchase even more healthy food for no additional costs.

**Where can I get more information on lead?**

# IS YOUR CHILD SAFE FROM LEAD POISONING?

## LEARN HOW TO PROTECT YOUR FAMILY: CREATE A LEAD SAFE HOME

### What causes lead poisoning?

There are many places in a home that can put babies and children in danger of lead poisoning.

Lead paint is the #1 cause of lead poisoning in Michigan and is often found in homes built before 1978. The older the home, the more likely that painted surfaces like windows, cupboards, doors and porches will contain lead paint.

Lead poisoning occurs most often when children come in contact with lead in the air, in dust and in lead paint. Lead can also be found in soil, drinking water if supplied by lead pipes, certain home remedies and is used in some hobbies and occupations.

Exposure to lead is a serious health threat. Carefully consider where your child spends time (childcare, relatives, your home) when thinking about lead poisoning hazards.

### How can I tell if my child has lead poisoning?

Talk to your doctor about testing your child's blood for lead poisoning.

#### When should my child be tested for lead poisoning?

Children should be tested at one and two years of age or if you think your child has been exposed to a lead.

To learn more about lead poisoning prevention and blood lead testing, call the Childhood Lead Poisoning Prevention Project:

**(517) 335-8885**

**(888) 322-4453**

### Take this quiz to see if your child may have lead poisoning:

Symptoms of lead poisoning can be silent—and hard to recognize. Preventing lead poisoning before it happens is the best way to keep your family safe. Take this quiz to see if your child may be at risk:

Does your child currently live in a home built before 1950 or have they lived in a home built before 1950 in the recent past? Do they spend time at or often visit a home built before 1950?

Yes No Don't know

Does your child currently live in a home built before 1978 that was recently remodeled? Have they lived in or often visited a home built before 1978 that was recently remodeled?

Yes No Don't know

Does your child have a brother, sister or playmate with lead poisoning?

Yes No Don't know

Does your child live with an adult whose job or hobby involves lead?

Yes No Don't know

Do you or your child's caregiver use home remedies that may contain lead?

Yes No Don't know

If you answered NO to all of these questions, your child is probably not at risk for lead poisoning.

If you answered YES or DON'T KNOW to any of these questions, talk to your doctor about testing your child for lead poisoning.

# MAKE EVERY DAY LEAD SAFE

**Safe Cleaning.** Use these steps to help keep your home clean and reduce your child's risk of exposure. Use these tips to clean your windows, doors, floors, porches, stairs and child play areas.

**Put on rubber gloves.** If you do not have rubber gloves, wash your hands well after cleaning.

**Use the right cleaners and supplies you can throw away.** Use soapy cleaners or products made to remove lead dust.

**Remove paint chips first.** Window areas and porches often have peeling paint and lead dust. Pick up paint chips you can see and throw them away in a plastic bag.

**Always wet-mop floors and window sills.** Do not broom lead dust. Throw away cloths after wiping each area. Replace mop water frequently.

**Don't use a vacuum unless it is a HEPA vacuum.** A regular vacuum will spread lead dust into the air you breathe. Some health departments have HEPA vacuums available to borrow.

**Rinse after cleaning.** Use clean water and a new mop head or fresh paper towels to wipe away suds.

**Always empty wash water down a toilet.**

**Repeat these steps weekly,** or when dirt and dust appear on floors, porches, window wells, window sills, stairs and children's play areas.

## For Homes with Lead Pipes

**If you use a water filter,** be sure it meets NSF/ANSI 53 standards for lead reduction.

✓ **Flush your pipes before drinking,** and only use cold water for cooking and mixing formula. Flush pipes by running the water for approximately 5 minutes.

✓ **Test.** Consider contacting your local water authority to have your water tested.

## Daily Lead Safe Practices

- Wash hands, bottles, pacifiers and toys often.
- Always take off shoes before going into the house.
- Watch your child's diet. Foods high in calcium and iron help keep lead from being absorbed by a child's body.
- Avoid using power sanders, open-flame torches, heat guns, dry scrapers and dry sandpaper or heat guns on painted surfaces.
- Paint over peeling or chipping paint.
- Use a certified Repair and Remodeling Professional when making updates to your home.
- Always use the safe cleaning methods listed above.

Thinking about remodeling your home? Need advice about identifying and removing lead paint? Call the Lead and Healthy Homes Section: 866-691-LEAD.

# Help Fight Lead Poisoning with a Healthy Diet

## Regularly Eat Healthy Foods

Children with empty stomachs absorb more lead than children with full stomachs.

Provide your child with four to six small meals during the day. The following nutrients can help protect your child from lead poisoning:

### Iron-Rich Foods

Normal levels of iron work to protect the body from the harmful effects of lead. Good sources of dietary iron include:

Lean red meats, fish, and chicken  
Iron-fortified cereals  
Dried fruits (raisins, prunes)

### Calcium-Rich Foods

Calcium reduces lead absorption and also helps make teeth and bones strong. Good sources of dietary calcium include:

Milk  
Yogurt  
Cheese  
Green leafy vegetables (spinach, kale, collard greens)

### Vitamin C-Rich Foods

Vitamin C and iron-rich foods work together to reduce lead absorption. Good sources of vitamin C include:

Oranges, orange juice  
Grapefruits, grapefruit juice  
Tomatoes, tomato juice  
Green peppers

# Simple Steps You Can Take

## to Protect Your Family from Lead Hazards

---

### If you think your home has high levels of lead:

- Make sure your children eat healthy, low-fat foods high in iron, calcium, and vitamin C.
- Get your children tested for lead, even if they seem healthy.
- Get your home tested for lead if it was built before 1978. Call 1-800-424-LEAD for more information.
- Always wash your hands before eating.
- Wash children's hands, bottles, pacifiers, and toys.
- Do not use imported pottery to store or serve food.
- Let tap water run for one minute before using.
- Use only cold water for making your baby's formula, drinking, and cooking.
- Regularly clean floors, windowsills, and other surfaces using wet methods that control dust.
- Wipe or remove shoes before entering your house.
- If you rent, it is your landlord's job to keep paint in good shape. Report peeling or chipping paint to your landlord and call your health department if the paint is not repaired safely.
- Take precautions to avoid exposure to lead dust when remodeling or renovating.
- Don't try to remove paint yourself!

# Frequently Asked Questions About Lead in Flint Water

- Lead is hard to avoid completely. It can be found in old paint, water pipes and brass water faucets, in dirt, at some job sites, and in metal used for some hobbies.
- The amount of lead found in some Flint homes' drinking water could affect kids' health.
  - Even small amounts of lead can harm kids' health because they are little and still growing.
  - Adults are less likely to be harmed by the levels found in the water.
- Filter your drinking water using a NSF-approved filter.
  - Find a NSF-approved filter at [http://www.gchd.us/docs/lead\\_filter\\_information.pdf](http://www.gchd.us/docs/lead_filter_information.pdf).
  - If you use City of Flint water, you can call 211 to find out where you can pick up a free water filter.
- Some filters can remove up to 99% of the lead in water when used properly. To be sure your filter is removing as much lead as it can, carefully follow the instructions that came with it.
  - Change the filter cartridge as often as you should.
  - Run only cold water through the filter.
- Even after changes to the water system, it may take a while before lead levels in your home's water drop. Use the tips below to know when it's best to use filtered water:

## Lead in Water

Although your water may be a different color sometimes, it is not caused by lead. It's important to remember:

- You can't see, smell, or taste lead in water.
- Lead won't change the color of your water.
- The only way to know what your home's lead levels are is by having your water tested in a lab.

Please call the Flint Water Department at 810-787-6537 to request a free or low-cost water test.

## In The Kitchen

Use filtered tap water for:

- Drinking (including making coffee, drink mixes, juice, baby formula)
- Cooking (even if you boil the water, the lead will stay in the water and food)
- Washing fruits and vegetables

You can use unfiltered tap water for:

- Washing your hands
- Washing dishes
- Wiping down countertops

## Cleaning

You can use unfiltered tap water for:

- Mopping floors
- Washing clothes

Your washing machine and dryer won't put lead from the water into the air of your home.

## In the Bathroom

Use filtered tap water for:

- Brushing kids' teeth

You can use unfiltered tap water for:

- Showers
- Baths (don't let kids drink the water as they play in the tub)
- Brushing your teeth (if you are an adult)

Lead will not cause rashes or other skin problems. However, if chlorine levels or other cleaners are high in the water, it may cause itchy or dry skin (similar to what can happen when you swim in a pool).

## Caring for Pets

Use filtered tap water for:

- Pets' water bowls

You can use unfiltered tap water for:

- Baths

If you notice your pet acting differently than normal, please contact your vet.

## Other Sources of Lead in Your Home

### Lead Paint

- Homes built before 1978 likely have lead paint, both inside and outside.
- Old paint is the most common way that kids are exposed to lead.

### Dirt

- If you live in the city, there may be lead in the dirt outside your home.
- Before 1996, gas and the exhaust from cars contained lead. More lead will be found in dirt in busy traffic areas.

### Dust

- The dust in your home can contain tiny amounts of both the paint and the dirt that contain lead.

### Hobbies & Jobs

- Solder, fishing sinkers, bullets, and stained glass framing materials are some of the items in your home that may contain lead. You could also track home lead dust from your job site.

## Have Questions?

For more information about protecting yourself and your family from lead, please visit:

[www.michigan.gov/lead](http://www.michigan.gov/lead)

Or you can call the Michigan Department of Health and Human Services at:

**1-800-648-6942**

The staff at this number will help direct you to the best department that can answer your questions about lead in your home.

To request a free or low-cost water test, please call the Flint Water Department at:

**1-810-787-6537**

To find out if you can get a free water filter, please call 211.

**Subject:** RE: Breast feeding and maternal lead exposure

In adults when we see high levels it is generally an occupational exposure and inhalation of lead fumes in industrial exposure settings like battery manufacturing, lead smelting, and stained lead glass.

A couple of factors are important to remember when we are talking about lead exposure in adults versus children. Absorption rates from gastrointestinal exposure are lower in adults versus children. So where a toddler might absorb about 50%, absorption rates decline in adults to 3-10%. About 90% of lead will end up in the bone where it mimics calcium. It causes less harm there than if it went to soft tissues like the liver or kidneys. The problem is that under circumstances that cause calcium mobilization, lead stored in the bone may remobilize and circulate in the blood, elevating blood lead levels. The mobilization of stored lead with pregnancy, menopause, and aging is a cause for concern. So to help mitigate that there should be an emphasis on good nutrition and a calcium rich diet. Pregnant and breastfeeding woman should be sure to take their vitamins to minimize calcium mobilization from the bones.

Reinforcing these messages would help minimize exposure.

Looping I our toxicologist, as we ha e discussed this. Note that anyone should be using filtered or bottled water now, so that the issue of which house and which risk should already be addressed. Also- we do not have any data supporting adults with blood lead levels that high ( Off top of my head) and none have been in the 40's or higher since Long before April 2014.

Regardless, Linda and I had talked about breastfeeding moms... She can help.

Thank you for your quick answer!

This makes sense for pregnant moms, as there is no choice as to how the baby will get its nourishment. However, for breastfeeding moms in households in which filters will be provided, **do we know that breast milk (with possible higher maternal BLLs secondary to bone release from chronic exposure) is preferable to filtered tap water?** Does anybody know what the range of breast milk lead levels are in women

who have BLLs around 30 or 35? In the data that Dr. Reynolds and I looked at (previously attached) the BLLs didn't go that high, and it said that the breast milk levels fluctuated.

In the Ettinger paper the highest maternal BLL with a breast milk sample was 29.9 (Table 1), which is less than the level of 40 recommended in the MDHHS handout. The article said that "Breast milk lead expressed as percentage of maternal blood lead ranged from 0.4 to 9.2% (mean = 1.6%, SD = 1.2%)" -- p 929. The means a less an issue than the outliers, considering some of the extremely high water lead levels that have been found in the city and also the difficulty of predicting which houses might be most at risk.

I'm not sure if there is other, better data out there that might shed some light on this? Also, your attached pamphlet does deflect patients back to their doctors, but I'm not sure that those of us in the GCMS feel that we have adequate information to advise people further.

**Subject:** RE: Breast feeding and maternal lead exposure

Good morning,

Note that MDHHS/GCHD is about to send out (by emails and hopefully you all can disseminate at will to your colleagues?) a provider letter with provider resources, which will also all be on the webpage we are using. Parent letters with resources for them will be going out in hard copy through schools and daycares----all of this will be occurring in the next couple of days. Note that there is already a flyer on the [Michigan.gov/flintwater](http://Michigan.gov/flintwater) webpage for pregnant moms and breastfeeding----note that, like all others including children, treatment only occurs for levels over 45, but removing lead from any environmental sources is important at all times.

We have already gotten information regarding pregnancy and lead levels from CDC: (Mary Jean Brown): "Pregnant women who work with lead should be tested (occupational, hobby, shooting ranges, renovation exposures). Worried women who want to be tested should not be refused but if their only exposure is the water the only intervention is to stop drinking the water from the river and it is my understanding that that has been accomplished. There is no medical treatment for pregnant women (chelation therapy) in the first trimester because of teratogenic concerns. At blood lead levels  $\geq 45$  in later trimesters, chelation may be considered to protect the fetus but should only be done in consultation with someone familiar with chelation in early childhood and high risk pregnancies. A general alert to area OB/Gyn's

and maternity clinics that patients should not drink water from the river, would be advisable.”

Dear Eden,

Our county medical society is in the process of drafting a “fact sheet” specifically for our physician members to try and help them help their patients. We are endeavoring to keep the content consistent with the other messaging going out, but to use as many channels as we can, and to make this very easy for physicians to digest (i.e. brief and pertinent to their patients). I am attaching our draft to this email, as well as some of the articles that we have found.

One of the questions that came up is what to tell lead-exposed mothers who are pregnant or breastfeeding. We have pulled a number of articles that talk about lower maternal BLLs, but these are usually in the context of lower lead levels in drinking water. We are not sure if these recommendations still hold in our situation: the water is variable, the mothers are not routinely tested (should they be?), and lead is released from maternal bone for a long time. We also read that the lead levels fluctuate. All of this is to say, we are not certain that breastfeeding is safer than using filtered water in our situation (though it pains us as pediatricians and family docs to suggest this) and also, what the safe BLL is for a mother? The MDHHS recommendation of 40 in the recent Lead Week Toolkits seemed high, considering the fluctuating BLL and bone storage.

You had previously asked your toxicologist about the copper levels for us, and I was hoping you might pose this question to them as well.

Thank you for your help!

**Subject:** RE: Tox question- Brest feeding and Pb

CDC guidance on lead exposure in pregnancy and lactation is attached. Breast milk section starts on page 97. Breast milk level is generally less than 3% of maternal BLL.

Recommendations in the Executive Summary:

The adverse developmental effects of  $\geq 5$   $\mu\text{g}/\text{dL}$  in infant blood lead level was of greater concern than the risks of not breastfeeding. Thus, CDC encourages mothers with blood lead levels  $< 40$   $\mu\text{g}/\text{dL}$  to breastfeed, however, mothers with higher blood lead levels are encouraged to pump and discard their breast milk until their blood lead levels drop below 40  $\mu\text{g}/\text{dL}$ .

In a nutshell... lead harm outweighs the benefits of breastfeeding and concerned women should talk with their Dr. and get their own blood tested.

Chief

November 2010  
U.S. Department of Health and Human Services  
Atlanta, GA

This document is dedicated to the memories of Michael W. Shannon, MD, MPH (1953-2009) and Kathryn R. Mahaffey, PhD (1943-2009).

Dr. Shannon was a gifted scientist, a respected leader in medicine and public health, and a tireless advocate for prevention of childhood lead poisoning. His contributions to the scientific literature documenting unrecognized sources of exposure and describing innovative management protocols did much to improve the lives of countless children both in the United States and around the world.

Dr. Mahaffey's early work to ensure that blood samples collected during the National Health and Nutrition Examination Surveys increased understanding of lead poisoning and contributed to the identification of lead in gasoline and paint as primary routes of lead exposure in children. She was actively involved in preventing lead exposure in children for over 35 years and provided invaluable assistance with this document.

The thoughtful contributions of Drs. Shannon and Mahaffey to the CDC Advisory Committee on Childhood Lead Poisoning Prevention will be deeply missed.

## PREFACE

Lead exposure during pregnancy and breastfeeding can result in lasting adverse health effects independent of lead exposure during other life stages. However, to date there has been limited guidance available for clinicians and the public health community regarding the screening and management of pregnant and lactating women exposed to high levels of lead. Recognizing the need for national recommendations, the Centers for Disease Control and Prevention and the Advisory Committee on Childhood Lead Poisoning Prevention convened a workgroup of recognized experts to review the existing evidence for adverse effects of past and current maternal lead exposure on maternal health and fertility and on the developing fetus, infant, and child in prenatal and postnatal states and to propose evidence-based strategies for intervention.

These *Guidelines for the Identification and Management of Lead Exposure in Pregnant and Lactating Women* are based on scientific data and practical considerations regarding preventing lead exposure during pregnancy, assessment and blood lead testing during pregnancy, medical and environmental management to reduce fetal exposure, breastfeeding, and follow up of infants and children exposed to lead *in utero*.

The guidelines also outline a research agenda that will provide crucial information for future efforts to prevent and treat lead exposure during pregnancy and lactation. Further research is needed for a better understanding of lead's effect on pregnancy outcomes and infant development; lead kinetics across the placenta and in breast milk and their relationship to long-term health effects; genetic susceptibility to damage from lead; as well as the pharmacokinetics, effectiveness, and safety of chelating agents in the pregnant woman. Research is also needed to address important clinical and public health needs including validation of risk questionnaires for pregnant women, optimal timing of blood lead testing, and effective strategies for identification and treatment of pica in pregnant women.

I wish to thank the members of the Advisory Committee on Childhood Lead Poisoning Prevention, members of the Lead in Pregnancy Workgroup, and consultants who developed this document and acknowledge their contribution to the health of the nation's children. This document was voted on and approved with one abstention at the October 21-22, 2009, meeting of the Advisory Committee on Childhood Lead Poisoning Prevention. I believe this document represents a major advance in our efforts to prevent lead exposure in those most vulnerable.

Christopher Portier, PhD  
Director  
National Center for Environmental Health/Agency  
for Toxic Substances and Disease Registry  
Centers for Disease Control and Prevention

## EXECUTIVE SUMMARY

Despite improvements in environmental policies and significant reductions in U.S. average blood lead levels, lead exposure remains a concern for pregnant and lactating women, particularly among certain population subgroups at increased risk for exposure.

Recent National Health and Nutrition Examination Survey (NHANES) estimates suggest that almost 1% of women of childbearing age (15-44 years) have blood lead levels greater than or equal to 5 µg/dL (Centers for Disease Control and Prevention 2008, unpublished data). As documented in these guidelines, there is good evidence that maternal lead exposure during pregnancy can cause fetal lead exposure and can adversely affect both maternal and child health across a wide range of maternal exposure levels.

However, guidance for clinicians regarding screening and managing pregnant and lactating women exposed to lead has not kept pace with the scientific evidence. There are currently no national recommendations by any medical or nursing professional association that covers lead risk assessment and management during pregnancy and lactation. Currently, New York State, New York City, and Minnesota are the only jurisdictions that have issued lead screening guidelines and follow-up requirements for pregnant women by physicians or other providers of medical care. The lack of national recommendations about testing pregnant women and managing those identified with lead exposure above background levels has created confusion in the clinical and public health sectors. In response to this need, the Centers for Disease Control and Prevention (CDC) Advisory Committee on Childhood Lead Poisoning Prevention (ACCLPP) convened the Lead and Pregnancy Work Group to review the existing evidence for adverse effects of past and current maternal lead exposure on maternal health and fertility and on the developing fetus, infant, and child in prenatal and postnatal states. This document presents ACCLPP's summary of the evidence to date from human studies, conclusions, and CDC recommendations regarding

- prevention of lead exposure for pregnant and lactating women,
- risk assessment and blood lead testing of pregnant women,
- medical and environmental management,
- breastfeeding, and
- follow up of infants and children of mothers with blood lead levels exceeding national norms.

In instances where there is an absence of clear and convincing evidence, recommendations are based on the combined clinical, practical, and research experience of ACCLPP and work group members. This document also identifies research, policy, and health education needs to inform policy and improve care of pregnant and lactating women with lead exposure above background levels. The guidelines do not address all women of childbearing age, nor does it address male reproductive health issues associated with lead exposure.

The evidence that prenatal lead exposure impairs children's neurodevelopment, placing them at increased risk for developmental delay, reduced IQ, and behavioral problems, is convincing. The research also suggests, but is inconclusive, that fetal lead exposure at levels found in the United States results in low birth weight or adverse health conditions in adults who were exposed to lead *in utero*, among others. Further research is needed for a better understanding of several biomedical issues, including pregnancy outcomes and infant development associated with maternal lead exposure during pregnancy, lead kinetics across the placenta and in breast milk and their relationship to long-term health effects, genetic susceptibility to damage from lead, pharmacokinetics and effectiveness of chelating agents in the pregnant woman, among others. Research is also needed to address important clinical and public health needs, like validation of risk questionnaires for pregnant women, optimal timing of blood lead testing during pregnancy, and effective strategies for identification and treatment of pica in pregnant women.

This document provides guidance based on current knowledge regarding blood lead testing and follow-up care for pregnant and lactating women with lead exposure above background levels. Because there is no apparent threshold below which adverse effects of lead do not occur, CDC has not identified an allowable exposure level, level of concern, or any other bright line intended to connote a safe or unsafe level of exposure for either mother or fetus. Instead, CDC is applying public health principles of prevention in recommending follow-up blood lead testing and interventions when prudent. These guidelines recommend follow-up activities and interventions beginning at blood lead levels (BLLs)  $\geq 5$   $\mu\text{g}/\text{dL}$  in pregnant women. Unlike the BLL level of concern of 10  $\mu\text{g}/\text{dL}$  for children, which is a communitywide action level, a BLL of 5  $\mu\text{g}/\text{dL}$  in pregnant women serves a different purpose: it flags the occurrence of prior or ongoing lead exposure above background levels, which may not otherwise be recognized. The vulnerability of a developing fetus to adverse effects and the possibility of preventing additional exposures postnatally justify intervention for pregnant women showing evidence of lead exposure above background levels.

CDC does not recommend blood lead testing of all pregnant women in the United States. State or local public health departments should identify populations at increased risk for lead exposure and provide community-specific risk factors to guide clinicians in determining the need for population-based blood lead testing. Routine blood lead testing of pregnant women is recommended in clinical settings that serve populations with specific risk factors for lead exposure. Health care providers serving lower risk communities should consider the possibility of lead exposure in individual pregnant women by evaluating risk factors for exposure as part of a comprehensive occupational, environmental, and lifestyle health risk assessment of the pregnant woman, and perform blood lead testing if a single risk factor is identified. Assessment for lead exposure, based on risk factor questionnaires or blood lead testing, should take place at the earliest contact with the pregnant patient.

For all patients, but especially those with known lead exposures, health care providers should provide guidance regarding sources of lead and help identify potential sources of lead in the patient's environment. Risk factors for lead exposure above background levels in pregnant women differ from those described in young children. Important risk factors for lead exposure in pregnant women include recent immigration, pica practices, occupational exposure, nutritional status, culturally specific practices such as the use of traditional remedies or imported cosmetics, and the use of traditional lead-glazed pottery for cooking and storing food. Lead-based paint is less likely to be an important exposure source for pregnant women than it is for children, except during renovation or remodeling in older homes. Pregnant women with blood lead concentrations of 10  $\mu\text{g}/\text{dL}$  or higher should be removed from occupational lead exposure.

Follow-up testing; increased patient education; and environmental, nutritional, and behavioral interventions are indicated for all pregnant women with blood lead levels greater than or equal to 5  $\mu\text{g}/\text{dL}$  in order to prevent undue exposure to the fetus and newborns. Since lead exposure at these levels affects only approximately 1% of U.S. women of childbearing age, the recommendations in this guidance document should not significantly impact many individuals or clinical practices.

The essential activity in management of pregnant women with blood lead levels  $\geq 5$   $\mu\text{g}/\text{dL}$  is removal of the lead source, disruption of the route of exposure, or avoidance of the lead-containing substance or activity. Source identification beyond obtaining a thorough environmental and occupational history should be conducted for BLLs  $\geq 15$   $\mu\text{g}/\text{dL}$  in collaboration with the local health department, which will conduct an environmental investigation of the home environment in most jurisdictions and an investigation of the work environment (in some jurisdictions). Women who engage in pica behavior, regardless of the substance consumed, may benefit from nutritional counseling. Pregnant and lactating women with a current or past BLL  $\geq 5$   $\mu\text{g}/\text{dL}$  should be assessed for the adequacy of their diet and provided with prenatal vitamins and nutritional advice emphasizing adequate calcium and iron intake. Chelation therapy during pregnancy or early infancy may be warranted in certain circumstances where the maternal or neonatal blood lead exceeds  $\geq 45$   $\mu\text{g}/\text{dL}$  and in consultation with an expert in lead poisoning. Insufficient data exist regarding the advisability of chelation for

pregnant women with BLL  $<45 \mu\text{g/dL}$ . CDC recognizes the important benefits of breastfeeding for both the mother and child and considered the adverse health and developmental effects associated with lead exposure compared to those associated with not breastfeeding. The adverse developmental effects of  $\geq 5 \mu\text{g/dL}$  in infant blood lead level was of greater concern than the risks of not breastfeeding. Thus, CDC encourages mothers with blood lead levels  $<40 \mu\text{g/dL}$  to breastfeed, however, mothers with higher blood lead levels are encouraged to pump and discard their breast milk until their blood lead levels drop below  $40 \mu\text{g/dL}$ . These recommendations are made for the U.S. population and are not appropriate in countries where infant mortality from infectious diseases is high. Specific recommendations regarding appropriate follow-up blood lead testing of the mother and infant are provided.

# Summary of Public Health Actions Based on Maternal and Infant Blood Lead Levels

## All Women of Child-Bearing Age

Provide anticipatory guidance, provide health education materials, test workers according to established guidelines, and manage elevated BLLs according to adult lead guidelines (OSHA Medical Guidelines)

### Pregnant Women

Confirm and referrals

Provide anticipatory guidance

Notify health department

Consider chelation therapy; Consult with an expert in lead poisoning

Environmental assessment & abatement of lead paint hazards

Medical emergency

Chelation therapy

Medical removal from occupational exposure

### Lactating Women

Breastfeeding should be encouraged

Breastfeeding may be initiated if infant's BLLs monitored

Lactation should be continued, but breast milk should be pumped and discarded until BLLs <40

### Neonates (<1 Month of Age)

Follow-up test within 2 weeks

Follow-up test within 1 month

Follow-up test within 24 hours

Follow local pediatric lead screening guidelines

Consider chelation therapy; Consult with an expert in lead poisoning

### Infants (1 - 6 Months)

Follow-up test within 1-3 months

Follow-up test within 3 months

Follow-up test within 1 month

Follow-up test within 24 hours

Follow local pediatric lead screening guidelines

Consider chelation therapy; Consult with an expert in lead poisoning

Micrograms/Deciliter 0 5 10 15 20 25 30 35 40 45 50 55 60 65 70

## MEMBERS OF THE WORK GROUP ON LEAD AND PREGNANCY

### *Chairperson*

Jessica Leighton, PhD, MPH

Deputy Commissioner, New York City Department of Health & Mental Hygiene

### *Members*

David Bellinger, PhD, MSc

Professor of Neurology

Children's Hospital of Boston, Harvard Medical School

Carla Campbell, MD, MS

Philadelphia Department of Public Health and Children's Hospital of Philadelphia

Parent  
Decatur, Georgia  
Term: 07/03/2008-5/31/12

## GLOSSARY

**abatement:** any set of measures designed to permanently eliminate lead-based paint or lead-based paint hazards.

**ABLES:** Adult Blood Lead Epidemiology and Surveillance program, a CDC-funded state-based program to track laboratory-reported BLLs in adults.

**ACCLPP:** CDC Advisory Committee on Childhood Lead Poisoning Prevention.

**ACOG:** American College of Obstetrics and Gynecology.

**acute:** having or experiencing a rapid onset and short duration.

**AI (adequate intake):** a recommended average daily nutrient intake level, based on estimations of average nutrient intakes by groups healthy people.

**alternative medicines:** for these guidelines, alternative medicines are defined as nonstandard therapies not sanctioned in modern Western medicine; typically from other countries; and usually unregulated in the United States, including folk, traditional, botanic, herbal, alternative, and complementary therapies, medicines, agents, and remedies (also “traditional medicines”).

**anemia:** a condition in which there is a reduction of the number or volume of red blood cells or of the total amount of hemoglobin in the bloodstream

**antenatal:** occurring or existing before birth (also “prenatal”).

**antepartum:** pertaining to the period before delivery or birth.

**anticipatory guidance:** practical information given to individuals to promote health before a certain milestone, such as pregnancy, is reached.

**antioxidant:** any substance that reduces damage due to oxygen in the body.

**AOEC:** Association of Occupational and Environmental Clinics.

**apoptosis:** a form of cell death in which a programmed sequence of events leads to the elimination of cells without releasing harmful substances into the surrounding area.

**asymptomatic:** without observable signs or reportable symptoms of illness.

**at-risk populations:** populations with characteristics, behaviors, or lifestyles (including home, work, and hobbies) that put them at increased risk for lead exposure.

**ayurveda:** one of India’s traditional systems of medicine, involving a holistic system of healing and natural (herbal) medicines, that has been practiced for over 5,000 years.

**bioavailable:** readily absorbed and used by the body.

**biokinetics:** the study of movements of or within organisms.

**biomarker (biological marker):** a measure of exposure to lead, or other substance, that is measured in human tissue and corresponds to absorbed dose.

**BLL (blood lead level):** the concentration of lead in a sample of blood expressed in micrograms per deciliter (µg/dL) or micromoles per liter (µmol/L) (1 µg/dL = 0.048 µmol/L).

**breast milk lead:** levels of lead in breast milk; the concentration of lead in a sample of maternal breast milk is usually expressed in micrograms per liter ( $\mu\text{g/L}$ ).

**bone lead:** long-lived stores of lead from past exposure that is accumulated in the body's skeletal system; measured in micrograms ( $\mu\text{g}$ ) of lead/gram bone mineral.

**bone mobilization or bone turnover:** the process by which the body dissolves part of the bone in the skeleton in order to maintain or raise the levels of circulating calcium in the blood or for pathological reasons, such as immobilization, age-related osteoporosis, or hyperthyroidism.

**bone resorption:** the break down and wearing away of bone tissue that results in the release of bone minerals into circulation.

**care coordination:** the formal coordination of the care of a mother or infant with a BLL that exceeds a specific value and making available existing services as needed to the mother-infant pair.

**case management:** the follow-up care of a pregnant/lactating woman with a blood lead level  $\geq 5 \mu\text{g/dL}$ , and her newborn infant, if necessary. Case management includes a) client identification and outreach, b) individual assessment and diagnosis, c) service planning and resource identification, d) linkage of clients to needed services, e) service implementation and coordination, f) monitoring of service delivery, g) advocacy, and h) evaluation.

**casein:** the main protein found in milk and other dairy products.

**CDC (Centers for Disease Control and Prevention):** part of the U.S. Department of Health and Human Services.

**chelation therapy:** the use of a chelating agent (chemical compounds that bind to metals) to remove toxic metals, such as lead, from the body.

**chronic:** being long-lasting and recurrent.

**CI (confidence interval):** an interval estimate that defines an upper and lower limit with an associated probability.

**clearance standards:** maximum allowable lead dust levels (established by the U.S. Department of Housing and Urban Development and the U.S. Environmental Protection Agency) on floors and interior window sills after a residence has undergone lead hazard control work.

**CLPPP (Childhood Lead Poisoning Prevention Program):** CDC-funded state or local program to prevent childhood lead poisoning.

**conception:** union of the sperm and the egg which marks the onset of pregnancy (also "fertilization").

**confirmatory test:** a venous blood lead test performed after a previous capillary, filter paper, or venous blood lead test to verify the results before interventions occur.

**congenital anomaly:** a structural or functional abnormality of the human body that develops before birth but is usually identified in the period just after birth or in early life.

**contraindication:** a condition that makes a particular treatment or medical procedure inadvisable.

**creatinine:** a chemical waste product generated from muscle processes that create and use energy in the human body; measured to determine if kidneys are functioning properly.

**cumulative:** increasing by successive additions over a period of time.

**dyad:** two individuals or units regarded as a pair, such as the mother-infant pair.

**DRI (dietary reference intake):** a set of dietary reference values introduced in the 1990s with the primary goal of preventing nutrient deficiencies, but also reducing the risk for chronic diseases such as osteoporosis, cancer, and cardiovascular disease.

**EAR (estimated average requirement):** nutrient intake levels expected to satisfy the needs of 50% of the people in a particular age group.

**encephalopathy:** any diffuse disease of the brain that alters brain function or structure. Lead exposure is one of many possible causes of encephalopathy. Lead encephalopathy is a life-threatening emergency associated with high blood lead levels and often characterized by coma, seizures, ataxia, apathy, bizarre behavior, and poor physical condition.

**endogenous:** developing or originating from within the body.

**endothelium:** a thin layer of cells that line the body's hollow organs including blood vessels.

**environmental investigation:** an investigation of the residence (or other place where person spends significant amounts of time) by trained personnel to identify lead hazards.

**exchange transfusion:** simultaneous withdrawal of the recipient's blood and transfusion with the donor's blood.

**exogenous:** developing or originating from outside the body.

**EPA (U.S. Environmental Protection Agency; U.S. EPA):** federal agency charged with protecting human health and the environment by writing and enforcing regulations based on laws passed by Congress.

**FDA (U.S. Food and Drug Administration; U.S. FDA):** federal agency responsible for assuring the safety, efficacy, and security of human and veterinary drugs, biological products, medical devices, the U.S. food supply, cosmetics, and products that emit radiation.

**fecundity:** the potential reproductive capacity of an organism or population, as measured by the number of reproductive cells capable of reproducing (e.g., eggs and sperm).

**ferritin:** the body's major iron-carrying protein, which is measured to monitor iron status.

**fertility:** the ability to conceive and have children through normal sexual activity.

**Fetal Origins of Adult Disease (or Barker) hypothesis:** the suggestion that prenatal adverse nutritional or environmental conditions affect fetal development and have lifelong health and developmental consequences.

**fetus:** the unborn human offspring from the end of the 8th week after conception (when the major structures have formed) until birth.

**first trimester (of pregnancy):** time period extending from the first day of the last menstrual period through 12 weeks of gestation. The first trimester is a critical window of fetal development that is important for the formation and development of organs and organ systems.

**follow-up test:** a blood lead test used to monitor the status of a person with a previously blood test indicating excessive exposure to lead.

**gestation:** period of time from conception to birth.

**gestational age:** the age of a fetus or newborn, counting from the time of fertilization, usually measured in weeks, and calculated from the first day of the last menstrual period.

**gestational hypertension:** a type of high blood pressure that first occurs during pregnancy.

**hemoglobin:** a protein in red blood cells that transports oxygen.

**hematopoiesis:** the formation or production of all types of blood cells.

**HUD (U.S. Department of Housing and Urban Development):** federal agency that develops and executes policies on housing and cities.

**hyperuricemia:** a buildup of excess uric acid (a waste product) in the blood.

**immigration:** the one-way inward movement of individuals into a population or population area, usually to a country or region, to which one is not originally born.

**infant:** a child in the earliest period of life (for the purposes of this document, from 0 to 6 months of age).

**IOM (Institute of Medicine):** a nonprofit agency established in 1970 under the charter of the National Academy of Sciences that provides independent, objective, evidence-based advice to policymakers, health professionals, the private sector, and the public.

**interim controls:** a set of measures designed to temporarily reduce human exposure to lead-based paint hazards.

*in utero:* “within the uterus” (womb) where the unborn baby develops.

**iron deficiency:** a disorder that occurs when there is not enough iron in the body, causing problems with red blood cell production, muscle function, and numerous other effects, including growth and developmental impairment.

**K-x-ray fluorescence:** a noninvasive (outside the body) technique for the measurement of lead in bone.

**lactation:** the period after childbirth when milk is produced and secreted from the mother’s breasts to provide nourishment to the baby.

**lead-based paint:** paint or other surface coating that contains lead equal to or exceeding 1.0 milligram per square centimeter or 0.5 percent by weight (5,000 parts per million), as defined by 302(c) of the Lead-Poisoning Prevention Act (42 U.S.C. 4822(c)) and TSCA section 401(9) (15 U.S.C. 2681(9)).

**lead-based paint hazard:** any condition that causes exposure to lead from lead-contaminated dust, lead-contaminated soil, or lead-contaminated paint that is deteriorated or present in accessible surfaces, friction surfaces, or impact surfaces that would result in adverse human health effects as established by the appropriate federal agency.

**lead-glazed ceramic pottery:** ceramic ware or pottery manufactured mainly by artisans and small family businesses using a centuries-old tradition of low-temperature-fired lead glazes to vitrify the surface and color the objects, and often imported from Mexico and other countries.

**lead-safe:** housing or building units with no lead-based paint hazards as determined by a lead risk assessment or by dust sampling at the conclusion of lead hazard control activities.

**lead-safe work practices:** low-technology/best practices techniques, methods, and processes that minimize the amount of dust and debris created during the remodeling, renovation, rehabilitation, or repair of pre-1978 housing that are used to control, contain, and clean up lead dust and deteriorated lead-based paint hazards in a manner that protects both the workers and the occupants of the unit.

**low birth weight:** a baby that weighs less than 2,500 grams at birth.

**LPWG (Lead and Pregnancy Work Group):** subgroup of the CDC Advisory Committee on Childhood Lead Poisoning Prevention.

**medical management:** for this guidelines, medical management is the care provided by a health care provider to a pregnant/lactating woman or infant whose blood lead levels indicate exposure to lead above background levels. Medical management includes clinical evaluation for complications of lead exposure, family lead education and referrals, chelation therapy if appropriate, follow-up testing at appropriate intervals, and communication with local health department as necessary.

**µg/dL (micrograms per deciliter):** a unit of measure for blood lead concentration.

**milk-to-plasma ratio:** used to express the relative efficiency of passive transfer of a chemical from the blood into milk.

**neonate:** a newborn infant, less than 1 month of age.

**neurodevelopment:** normal growth and progression of the nervous system during the life of an organism, measurement of which usually incorporates aspects of intellectual and behavioral attainment.

**normotensive:** blood pressure in the normal range for a healthy individual given their age.

**nutrient:** substances that are vital to health and give us energy, growth, help repair body tissues, and regulate body functions. The two major nutrient groups are macronutrients (protein, carbohydrates, fat) and micronutrients (vitamins, minerals).

**nutrition:** the way the human body takes in and uses foods. Substances or ingredients in food that are sources of nutrition are called nutrients.

**NHANES (National Health and Nutrition Examination Survey):** a periodic assessment of the health and nutritional status of a representative sample of adults and children in the United States conducted by the CDC National Center for Health Statistics.

**NIOSH (National Institute for Occupational Safety and Health):** the part of CDC responsible for conducting research and making recommendations for the prevention of work-related illnesses and injuries.

**OSHA (Occupational Safety and Health Administration):** the main federal agency charged with promulgation and enforcement of safety and health regulations.

**observational study:** a type of study in which free-living individuals are observed and certain outcomes are measured with no attempt made to affect the outcome (for example, no treatment is given).

**organogenesis:** the formation of organs within a developing fetus that occurs within the first trimester of pregnancy (prior to 16 weeks gestation).

**PCP (primary care provider):** the health professional who oversees a patient's care, usually a physician, nurse practitioner, or physician's assistant.

**pica:** a pattern of deliberate ingestion of nonfood items.

**placenta:** a temporary organ joining the mother and fetus; it is attached to the wall of the uterus (womb) to transfer oxygen and nutrients to the baby during pregnancy.

**plasma:** the protein-containing fluid portion of the blood.

**plasma lead:** lead in the protein-containing fluid portion of the blood and available to cross cell membranes.

**postnatal:** the time period that occurs after birth, usually referring to the baby.

**postpartum:** the time period that occurs after birth, usually referring to the mother.

**ppb (parts per billion):** Represents the concentration of something in water or soil. One ppb represents one microgram of something per liter of water ( $\mu\text{g/L}$ ), or one microgram of something per kilogram of soil ( $\mu\text{g/kg}$ ).

**ppm (parts per million):** Represent the concentration of something in water or soil. One ppm represents one milligram of something per liter of water ( $\text{mg/L}$ ) or 1 milligram of something per kilogram soil ( $\text{mg/kg}$ ).

**preeclampsia:** a condition in pregnancy characterized by a sharp rise in blood pressure, protein in the mother's urine, and swelling of the hands and feet; this condition has negative consequences for both the mother and baby if not identified and treated promptly.

**pregnancy:** the period from conception to birth when a woman carries a developing fetus (baby) in her uterus (womb), usually lasting about 9 months (40 weeks).

**pre- (or post-) menopause:** before (or after) the end of a woman's reproductive years; regular menstrual periods stop in menopause.

**preterm delivery:** the birth of a baby before 37 weeks gestation.

**prevalence:** the proportion of individuals in a population having a specific health condition.

**primary prevention:** preventing a problem before it occurs. Primary prevention of lead poisoning eliminates lead sources before exposure, thus preventing exposure.

**primigravid:** a woman who is pregnant for the first time.

**primiparous:** relating to a woman who has given birth only once.

**proteinuria:** excess protein in the urine.

**puberty:** onset of the biological capacity for reproduction

**RCT (randomized [placebo-controlled] clinical trial):** a study in which participants are assigned by chance to different treatment groups and the outcomes between the groups are compared.

**RD (registered dietitian):** a certified professional with the combined education and experience to conduct dietary assessments and advise clients on issues related to diet and nutrition.

**RDA (recommended dietary allowance):** used from 1941 until 1989 to evaluate food choices that would meet the nutrient requirements of groups or populations with the primary goal of preventing diseases caused by nutrient deficiencies.

**renal:** having to do with the kidneys.

**renovation:** construction and/or home or building improvement measures (e.g., window replacement, weatherization, remodeling, repairing).

**risk factor questionnaire:** a set of questions designed to elicit responses from an individual that can identify their characteristics that can increase that person's chances of, in these guidelines, being exposed to lead from various sources.

**screening (blood lead screening):** for lead poisoning, a laboratory test for lead that is performed on the blood of an asymptomatic person to determine if that person has evidence of lead exposure above background levels.

**secondary prevention:** responding to a problem after it has been detected. Secondary prevention of lead poisoning involves identifying persons with confirmed lead exposure and eliminating or reducing additional lead exposure.

**spontaneous abortion (or miscarriage):** the loss of a fetus before the 20th week of pregnancy.

**Tanner scale or Tanner stage:** used to define physical measurements of a child's development based on external primary and secondary sex characteristics, such as the size of the breasts or genitalia and development of pubic hair.

**targeted screening:** blood lead testing of some, but not all, individuals in a population or group designated as being at increased risk for lead exposure.

**threshold:** an established dose or level below which an effect does not occur.

**TTDI (maximum total tolerable daily intake):** a term used by the FDA to caution against excessive intake of nutrients that can be harmful in large amounts.

**toxicokinetics:** the fate and transport of chemicals in the human body.

**traditional medicines:** see alternative medicines.

**umbilical cord:** the tubal structure (consisting of two arteries and one vein) that connects the fetus (baby) to the placenta, supplying blood, oxygen and nutrients to the baby during pregnancy.

**universal screening:** the blood lead testing of all persons in a population or group, such as pregnant women or city residents.

**U.S. PHSTF (U.S. Preventive Health Services Task Force):** An independent panel of experts in primary care and prevention that systematically reviews the evidence of effectiveness and develops recommendations for clinical preventive services.

**WIC:** Special Supplemental Nutrition Program for Women, Infants, and Children.

### KEY POINTS

- Lead exposure remains a public health problem for certain groups of women of childbearing age and for the developing fetus and nursing infant. Prenatal lead exposure has known influences on maternal health and infant birth and neurodevelopmental outcomes.
- Bone lead stores are mobilized in pregnancy and lactation for women with prior lead exposure, which is a concern since lead released into maternal blood and breast milk can adversely affect the fetus or newborn.
- Certain population subgroups of women at increased risk for exposure have been identified and may be highly exposed, particularly the following: workers in certain occupations; foreign-born recent immigrants; and those practicing certain behaviors associated with lead exposure, such as pica or renovation of older homes.
- Identifying pregnant women with a history of lead poisoning or who are currently exposed to lead above background levels and preventing additional lead exposure can help prevent adverse health outcomes in these children.

Despite improvements in environmental policies and significant reductions in U.S. average population blood lead levels, lead exposure remains a concern for pregnant and lactating women among certain population subgroups at increased risk for exposure. There is increasing awareness that unintended exposures to environmental contaminants, such as lead, adversely affect maternal and infant health, including the ability to become pregnant, maintain a healthy pregnancy, and have a healthy baby. In the United States, women of childbearing age represent approximately 42% of the total population (American Community Survey 2004) and at any given time almost 9% are pregnant (Crocetti et al. 1990). In the 2003-2006 National Health and Nutrition Examination Survey (NHANES) survey, the 95th percentile for blood lead levels among women aged 15-49 was 2.4 micrograms per deciliter ( $\mu\text{g}/\text{dL}$ ). As Figure 1-1 indicates, blood lead levels among women aged 15-49 have dropped substantially since the 1976-1980 NHANES. Recent NHANES estimates suggest that almost 1% of women of childbearing age (15-49 years) have blood lead levels greater than or equal to 5  $\mu\text{g}/\text{dL}$  (Centers for Disease Control and Prevention 2008, unpublished data).

Lead exposure remains a public health problem for subpopulations of women of childbearing age and for the developing fetus and nursing infant for several important reasons. First, prenatal lead exposure has known influences on maternal health and infant birth and neurodevelopmental outcomes (Bellinger 2005). Research findings suggest that prenatal lead exposure can adversely affect maternal and child health across a wide range of maternal exposure levels. In addition, adverse effects of lead are being identified at lower levels of exposure than previously recognized in both child and adult populations (Canfield et al. 2003; Jusko et al. 2008; Lanphear et al. 2005; Menke et al. 2006; Navas-Acien et al. 2007; Tellez-Rojo et al. 2006).

Second, bone lead stores are mobilized during periods of increased bone turnover such as pregnancy and lactation. Over 90% of lead in the adult human body is stored in bone (Barry 1975; Barry and Mossman 1970), and may result in redistribution of cumulative lead stores from bone into blood during periods of heightened bone turnover, such as pregnancy and lactation (Gulson et al. 2003; Roberts and Silbergeld 1995). Since bone lead stores persist for decades, women and their infants may be at risk for continued exposure long after exposure to external environmental sources has been terminated.

Finally, there is evidence that a significant number of pregnant women, and presumably their infants, are being exposed to lead in the United States today. It is clear that exposed subgroups do exist and some may be highly exposed, particularly recent immigrants (Graber et al. 2006; Klitzman et al. 2002); workers in specific high-risk occupations (Calvert and Roscoe 2007); and those practicing certain behaviors, such as pica (Hackley and Katz-Jacobson 2003; Shannon 2003), use of culturally-specific remedies and products (Centers for Disease Control and Prevention 2004; Saper et al. 2004, 2008), and renovating older homes (Marino et al. 1990; Jacobs et al. 2002). Women living near hazardous wastes site or active smelters (Garcia-Vargas et al. 2001) and residents in countries still using leaded gasoline (Albalak et al. 2003) may also be highly exposed.

Although lead exposure remains an important potential risk to the fetus, until now, little emphasis has been placed on developing guidelines for prenatal health care providers and women of childbearing age. There are currently no national recommendations or guidelines by any obstetric, family practice, pediatric, or nursing groups that cover lead risk assessment and management during pregnancy and lactation. Currently, New York State, New York City, and Minnesota are the only jurisdictions known to have issued lead screening regulations and follow-up recommendations for pregnant women by physicians or other health care providers (Minnesota Department of Health 2004; New York City Department of Health and Mental Hygiene 2006) [see Appendix I]. Other states have considered implementation of similar regulations or guidelines, and federal legislation has also been proposed. However, scientific discussion in this area has been limited.

Because no national recommendations exist, the Centers for Disease Control and Prevention (CDC) and local and state lead poisoning prevention programs have not been able to consistently respond to concerns from medical providers about when to test pregnant or lactating women for lead exposure and how to manage pregnant or lactating women who have been identified with lead exposure above background levels that have resulted from widespread ambient lead contamination and naturally occurring lead in the earth's crust. In response to this need, the Lead and Pregnancy Work Group was convened in April 2004 by the CDC Advisory Committee on Childhood Lead Poisoning Prevention (ACCLPP) to review the existing evidence for adverse effects of past and current maternal lead exposure on maternal health and fertility and on the developing fetus, infant, and child, and to develop recommendations on blood lead testing and management for pregnant and lactating women with lead exposure above background levels.

For the purposes of the review of existing scientific literature, the work group was divided into three subgroups: Prevalence, Risk, and Screening; Maternal, Pregnancy, and Child Outcomes; and Management, Treatment, and Other Interventions. The subgroups were asked to review the literature, summarize findings, and address the issues outlined in Appendix II. These guidelines do not include findings from animal studies, except when there are limited human data and consistent findings confirmed from multiple animal studies.

This document presents ACCLPP's summary of the evidence, provides guidance for preventing and treating lead exposure in pregnant and lactating women, and identifies research, policy, and education needs to improve health outcomes and care provided to pregnant women and their infants. These guidelines do not address all women of childbearing age, nor do they address male reproductive health issues associated with lead exposure.

**Figure 1-1. Distribution of Blood Lead Levels in U.S. Women of Childbearing Age (15-49 Years)**

### KEY POINTS

- For centuries, exposure to high concentrations of lead has been known to pose health hazards. Recent evidence suggests that chronic low-level lead exposure also has adverse health effects in both adults and children and no blood lead threshold level for these effects has been identified.
- CDC has not identified an allowable exposure level, level of concern, or any other bright line intended to connote a safe or unsafe level of exposure for either mother or fetus. Instead, CDC is applying public health principles of prevention to intervene when prudent.
- Epidemiologic and experimental evidence suggest that lead is a potent developmental toxicant, but many details regarding lead's mechanism of action have not been determined.
- Recent epidemiologic cohort studies suggest that prenatal lead exposure, even with maternal blood lead levels below 10 µg/dL, is inversely related to fetal growth and neurodevelopment independent of the effects of postnatal exposure, though the exact mechanism(s) by which low-level lead exposure, whether incurred prenatally or postnatally, might adversely affect child development remains uncertain.
- Lead may adversely impact sexual maturation in the developing female and may reduce fertility, but the scientific evidence is limited.
- Lead exposure has been associated with increased risk for gestational hypertension, but the magnitude of the effect, the exposure level at which risk begins to increase, and whether risk is more associated with acute or cumulative exposure, remain uncertain.
- Evidence is limited to support an association between blood lead levels from 10-30 µg/dL and spontaneous abortion. There are also few and inconsistent studies on the association between blood lead levels and preterm delivery.
- The available data are inadequate to establish the presence or absence of an association between maternal lead exposure and major congenital anomalies in the fetus.

### INTRODUCTION

For centuries, exposure to high concentrations of lead has been known to pose health hazards. High levels of exposure can result in delirium, seizures, stupor, coma, or even death. Other overt signs and symptoms may include hypertension, peripheral neuropathy, ataxia, tremor, headache, loss of appetite, weight loss, fatigue, muscle and joint aches, changes in behavior and concentration, gout, nephropathy, lead colic, and anemia. In general, symptoms tend to increase with increasing blood lead levels. A substantial body of recent epidemiologic and toxicologic research demonstrates that multiple health effects can occur at low to moderate blood lead levels previously without recognized harm. Health effects of chronic low-level exposure in adults include cognitive decline, hypertension and other cardiovascular effects, decrements in renal function, and adverse reproductive outcome (Agency for Toxic Substances and Disease Registry 2007).

This chapter focuses on the effects of maternal lead exposure on reproductive health, maternal health, pregnancy outcome, infant growth, and child neurodevelopment. Although the studies described in this chapter

focus on maternal exposures, paternal influences may also influence reproductive outcomes. Issues related to male-mediated reproductive toxicity for lead have been reviewed elsewhere (Apostoli et al. 1998; Jensen et al. 2006). In these guidelines, the discussion of scientific literature focuses on findings in humans. However, there also exists an extensive body of literature on the health effects of lead in experimental animals, which, while not cited, generally supports the human data. The reader is referred to other sources (Agency for Toxic Substances and Disease Registry 2007; U.S. Environmental Protection Agency 2006) for recent reviews of the experimental animal data.

An area of active study is the relationship between toxic exposures (such as lead) and fetal programming of growth and chronic disease. According to the Barker hypothesis (Barker 1990), now known more broadly as “fetal origins of adult disease,” poor development *in utero*—for example, low birth weight—increases the risk for obesity, hypertension, and cardiovascular disease during adulthood (Barker 1995; Khan et al. 2003). These epidemiologic findings highlight the importance of the intrauterine environment and are consistent with experimental evidence of long-term “programming” in early life. For example, because exposure to developmental toxicants, including lead, is associated with low birth weight, lead exposure to the fetus may increase the risk for later cardiovascular disease. Evidence supporting the fetal origins hypothesis is mounting rapidly (Ingelfinger and Schnaper 2005). However, evidence of effects from *in utero* lead exposure on adult disease are currently too limited to provide conclusive information.

### **IMPACT OF LEAD EXPOSURE ON SEXUAL MATURATION AND FERTILITY**

Few studies have examined possible lead-related effects on sexual maturation and fertility. Delay in puberty is an important yet understudied health outcome that may be associated with relatively low blood lead levels. Two studies have examined this outcome using cross-sectional data from the third NHANES (NHANES III). Selevan et al. (2003) analyzed blood lead and pubertal development by race in girls ages 8-18 years of age. Blood lead levels as low as 3 µg/dL were associated with 2 to 6 month delays in Tanner stage measurements (breast and pubic-hair development) and menarche in African-American and Mexican-American girls, while Non-Hispanic white girls experienced non-statistically significant delays in all pubertal measures. Wu et al. (2003) found that higher blood lead levels were significantly associated with delayed attainment of menarche and pubic hair development, but not breast development, even after adjustment for race/ethnicity, age, family size, residence, income, and body mass index. The cross-sectional design of NHANES III limits the ability to assess the temporal relation between blood lead and markers of puberty.

The studies on time-to-pregnancy associated with lead exposure have not been conclusive. One study of time-to-pregnancy did not suggest adverse effects of lead on fecundity at maternal blood lead concentrations less than 29 µg/dL. However, above this level, an association with longer time-to-pregnancy was found, but this was based on eight subjects (Sallmen et al. 1995). In a study of environmental lead exposure and reproductive health in Mexico City, no association was observed between maternal blood lead levels (mean = 9 µg/dL) and time-to-pregnancy in the first year (Guerra-Tamayo et al. 2003). However, in the subset of women with blood lead levels above 10 µg/dL, the likelihood of not achieving pregnancy after one year was five times higher (95% confidence interval [CI] 1.9-19.1) compared to women with blood lead levels below 10 µg/dL.

#### **Summary of Evidence: Sexual Maturation and Fertility**

Although studies are limited, there is some suggestion that blood lead at relatively low levels may lead to alterations in onset of sexual maturation and reduced fertility. These findings underscore the importance of considering sensitive markers of human fecundity in relation to lead exposure and should be confirmed in studies that can address the methodologic limitations of previous research.

### **IMPACT OF LEAD EXPOSURE ON MATERNAL HYPERTENSION DURING PREGNANCY**

There is some evidence that maternal physiologic parameters in pregnancy can be modulated by low levels of

lead exposure (Tabacova et al. 1994; Takser et al. 2005; Tellez-Rojo et al. 2004). However, the definitive relationship between lead exposure and maternal health outcomes in pregnancy is unclear. Lead is an established risk factor for hypertension in adults (Hertz-Picciotto and Croft 1993; Kosnett et al. 2007). Hypertension is one of the most common complications of pregnancy. There is substantial evidence that lead damages the vascular endothelium (Vaziri and Sica 2004) and that endothelial dysfunction is an important mediator of hypertension and preeclampsia in pregnancy (Karumanchi et al. 2005).

The most widely used classification of high blood pressure in pregnancy is that of the National High Blood Pressure Education Program Working Group (2000). This classification distinguishes between new hypertension arising during the pregnancy after 20 weeks (gestational hypertension) and preexisting hypertension (chronic hypertension).

It is important to differentiate between non-proteinuric hypertension and hypertension plus proteinuria (preeclampsia), as adverse clinical outcomes are more closely related to the latter. Severe hypertension usually defined as a systolic blood pressure of  $\geq 180$  mm Hg or diastolic blood pressure of  $\geq 110$  mm Hg, even in the absence of proteinuria, has been associated with adverse maternal and perinatal outcomes.

### **Gestational Hypertension**

Hypertension in pregnancy is defined as a systolic blood pressure of 140 mm Hg or higher or diastolic pressure of 90 mm Hg or higher that occurs after 20 weeks gestation in a woman with previously normal blood pressure. Increasing levels of lead in blood have been associated with gestational hypertension. Among 3,851 women delivering at a Boston hospital from 1979-1981, incidence of pregnancy hypertension and elevated blood pressure at delivery increased significantly as blood lead increased (mean blood lead  $6.9 \pm 3.3$   $\mu\text{g/dL}$ ). During delivery, lead levels correlated with both systolic (Pearson  $r = 0.081$ ,  $p = 0.0001$ ) and diastolic ( $r = 0.051$ ,  $p = 0.002$ ) blood pressure. Using a reference level of 0.7  $\mu\text{g/dL}$ , the relative risk doubled when blood lead level approached 15. There was no association, however, between blood lead level and risk for preeclampsia in this study (Rabinowitz et al. 1987).

Rothenberg et al. (1999a) found that blood lead was a statistically significant predictor of maternal blood pressure among 1,627 women immigrants (mean blood lead 2.3  $\mu\text{g/dL}$ ) but not among nonimmigrants (mean blood lead 1.9  $\mu\text{g/dL}$ ).

In a cross-sectional analysis of third trimester primigravid women in Malta ( $N = 143$ ), investigators compared normotensive women to those with gestational hypertension (Magri et al. 2003). Those with hypertension (mean blood lead  $9.6 \pm 6$   $\mu\text{g/dL}$ ,  $N = 30$ ) had significantly higher blood lead levels compared to normotensive controls (mean blood lead  $5.8 \pm 3$   $\mu\text{g/dL}$ ,  $N = 93$ ). A study of women with gestational age ranging from 30-41 weeks in Tehran, Iran, was conducted to assess the relationship between blood lead levels and gestational hypertension (Vigeh et al. 2004). Postpartum blood lead levels were significantly higher among 55 cases with hypertension (mean  $5.7 \pm 2.0$   $\mu\text{g/dL}$ ) in comparison to 55 age-matched normotensive controls (mean  $4.8 \pm 1.9$   $\mu\text{g/dL}$ ).

The prevalence of gestational hypertension has been shown to be increased even at blood lead levels less than 5  $\mu\text{g/dL}$ . Sowers et al. (2002) studied a cohort of 705 women aged 12-34 years who presented for prenatal care at one of three clinics in New Jersey with with mean (standard error) blood lead level equal to  $1.2 \pm 0.03$   $\mu\text{g/dL}$  and found maternal blood lead significantly associated with gestational hypertension.

Associations have also been found between gestational hypertension and bone lead. Rothenberg et al. (2002) reported on a prospective cohort study of 1,006 women aged 16-44 years enrolled during their third trimester in south central Los Angeles. This study included postpartum measures of tibia and calcaneus bone lead in addition to maternal blood lead levels. They found that each 10  $\mu\text{g/g}$  increase in calcaneus bone lead (range -30.6 to 49.9  $\mu\text{g/g}$ ) was associated with an almost two-fold increased risk for third-trimester hypertension, a

0.70-mm Hg increase in third-trimester systolic blood pressure, and a 0.54-mm Hg increase in third-trimester diastolic blood pressure.

### **Preeclampsia**

Preeclampsia, a pregnancy-specific disorder associated with increased maternal and perinatal morbidity and mortality, is defined as a) systolic blood pressure  $\geq 140$  mm Hg and/or diastolic blood pressure  $\geq 90$  mm Hg beginning after the 20th week of gestation and b) proteinuria  $\geq 300$  mg per 24 hours. Preeclampsia is usually associated with edema, hyperuricemia, and a fall in glomerular filtration rate. Blood lead levels have been associated with the risk for preeclampsia, although the evidence is less clear than for gestational hypertension. Dawson et al. (2000) observed significant differences between normotensive ( $N = 20$ ) and hypertensive or preeclamptic ( $N = 19$ ) pregnancies with respect to red blood cell lead content. They found maternal blood pressure to be directly proportional to RBC lead content; however, the selection criteria and study population in this small group at increased risk are not well-defined, so selection bias and confounding cannot be ruled out.

In the 2004 study by Vigeh et al. noted above, there were no significant differences in blood lead concentrations among hypertensive subjects with proteinuria ( $N = 30$ ) and those without proteinuria ( $N = 25$ ). In another study by Vigeh et al. (2006), among 396 postpartum women in Tehran, 31 with preeclampsia had significantly higher blood lead levels (mean  $5.09 \pm 2.01$   $\mu\text{g/dL}$ ) compared to 365 normotensive controls (mean  $4.82 \pm 2.22$   $\mu\text{g/dL}$ ) and significantly higher umbilical cord blood lead levels (mean  $4.30 \pm 2.49$   $\mu\text{g/dL}$  compared to  $3.5 \pm 2.09$   $\mu\text{g/dL}$ ) (Vigeh et al. 2006). A 13-fold increased risk for preeclampsia compared to normotensive controls (mean blood lead  $3.52 \pm 2.09$   $\mu\text{g/dL}$ ) was observed for every log-unit increase ( $\sim 3$   $\mu\text{g/dL}$ ) in blood lead. The 1987 study by Rabinowitz et al. of 3,851 women delivering in Boston found no association between blood lead level and risk for preeclampsia (Rabinowitz et al. 1987).

### **Summary of the Evidence: Effects on Maternal Hypertension**

Gestational hypertension and preeclampsia have been associated with adverse maternal and perinatal outcomes. Lead exposure has been associated with increased risk for gestational hypertension but the magnitude of the effect, the exposure level at which risk begins to increase, and whether risk is most associated with acute or cumulative exposure, remain uncertain. It is unclear whether lead-induced increases in blood pressure during pregnancy lead to severe hypertension or preeclampsia. However, even mild gestational hypertension can be expected to lead to increased maternal and fetal monitoring, medical interventions, and additional health care costs. Also, causality is unclear since preexisting hypertension reduces renal function, which in turn could result in the retention of lead.

## **IMPACT OF LEAD EXPOSURE ON PREGNANCY OUTCOMES**

### **Spontaneous Abortion**

There is consistent evidence that the risk for spontaneous abortion is increased by maternal exposure to high levels of lead. In her review of studies on the association between elevated blood lead levels and spontaneous abortion, Hertz-Picciotto (2000) includes a detailed summary of studies involving high blood lead levels, which come primarily from the literature on industrial exposures in Europe during the 19th century. Yet few studies have addressed the risk for spontaneous abortion at lower levels of exposure. Of those studies that have addressed this issue, most reports provide limited evidence to support an association between maternal blood lead levels of 0 to 30  $\mu\text{g/dL}$  and increased risk for spontaneous abortion (Laudanski et al. 1991; Lindbohm et al. 1992; McMichael et al. 1986; Murphy et al. 1990; Tabacova and Balabaeva 1993). However, the lack of evidence for an association at these low-to-moderate blood lead levels may be due to methodologic deficiencies in these studies, such as small sample sizes, lack of control for confounding, problems in case ascertainment, and/or limitations in exposure assessment (Hertz-Picciotto 2000).

The strongest evidence to date is a prospective study of pregnant women in Mexico City, which addressed most of the deficiencies of the prior studies and demonstrated a statistically significant dose-response relationship between maternal blood lead levels (average 11.0 µg/dL) and risk for spontaneous abortion (Borja-Aburto et al. 1999). Odds ratios for spontaneous abortion for the blood lead groups 5-9, 10-14, and >15 µg/dL were 2.3, 5.4, and 12.2, respectively, in comparison to the reference group (<5 µg/dL) ( $p$  for trend = 0.03) with an estimated increased odds for spontaneous abortion of 1.8 (95% CI = 1.1–3.1) for every 5 µg/dL increase in blood lead. In another study of pregnant women ( $N = 207$ ) from Mexico City (mean BLL 6.2 µg/dL), a 0.1% increment in the maternal plasma-to-blood lead ratio was associated with a 12% greater incidence of reported history of spontaneous abortion ( $p = 0.02$ ) (Lamadrid-Figueroa et al. 2007). On average, women with no spontaneous abortions had higher blood lead levels than women with one or more reported spontaneous abortions (6.5 vs. 5.8 µg/dL); however, with each additional abortion experienced, women had an 18% greater plasma-to-blood lead ratio on average ( $p < 0.01$ ). Women with a larger plasma-to-whole blood lead ratio may be at higher risk for miscarriage due to a greater availability of lead in plasma, which more readily crosses the placental barrier.

### **Preterm Delivery, Low Birth Weight, Length, and Head Circumference**

Andrews et al. (1994) reviewed the epidemiologic literature through the early 1990s on prenatal lead exposure in relation to gestational age and birth weight. These studies are somewhat contradictory, most likely due to methodologic differences in study design, sample size, and/or degree of control for confounding. The more recent and well-designed studies suggest that maternal lead exposure during pregnancy is inversely related to fetal growth, as reflected by duration of pregnancy and infant size. Irgens et al. (1998), using a registry-based approach, found that women occupationally exposed to lead were more likely to deliver a low birth weight infant than women not exposed to lead (odds ratio [OR] = 1.1, 95% CI = 0.98–1.29). A case-control study in Mexico City found cord blood lead to be higher in preterm infants (mean 9.8 µg/dL) compared to term infants (mean 8.4 µg/dL) (Torres-Sanchez et al. 1999). A birth cohort study, also conducted in Mexico City, found maternal bone lead burden to be inversely related to birth weight (Gonzalez-Cossio et al. 1997) and birth length and head circumference at birth (Hernandez-Avila et al. 2002). A study by Rothenberg et al. (1999) among Mexican-Americans found that over the 1–35 µg/dL range of maternal blood lead at 36 weeks of pregnancy, the estimated reduction in 6-month infant head circumference was 1.9 cm (95% CI = 0.9–3.0 cm).

### **Congenital Anomalies**

Very few studies have examined maternal lead exposure and risk for congenital malformations and, with one exception, none included biologic measures of lead exposure. Needleman et al. (1984) conducted a record review and reported an association between cord blood lead and minor congenital anomalies, but major anomalies did not show a similar association. In a case-control study, Bound et al. (1997) found an increased risk between living in an area with water lead levels greater than 10 µg/L (ppb) and delivering a child with a neural tube defect. Irgens et al. (1998) found, in a registry-based study, women occupationally exposed to lead were more likely to deliver an infant with a neural tube defect than women not exposed to lead (OR = 2.87, 95% CI = 1.1–6.4). In a case-control study conducted within the Baltimore-Washington Infant Study (Jackson et al. 2004), an association was observed between maternal occupational lead exposure and total anomalous pulmonary venous return although this relationship was not statistically significant (OR = 1.57, 95% CI = 0.64–3.47).

### **Summary of the Evidence: Pregnancy Outcomes**

Overall, increased risk for spontaneous abortion appears to be associated with blood lead levels  $\geq 30$  µg/dL. Limited evidence suggests that maternal blood lead levels less than 30 µg/dL could also increase the risk for spontaneous abortion, although these findings remain to be confirmed in further research. Maternal lead exposure may increase the risk for preterm delivery and low birth weight, although data are limited and a blood lead level at which the risks begin to increase has not been determined. The available data are inadequate to establish the presence or absence of an association between maternal lead exposure and major congenital anomalies in the fetus.

## IMPACT OF LEAD EXPOSURE ON INFANT GROWTH AND NEURODEVELOPMENT

### Infant Growth

Few studies have investigated the effects of prenatal lead exposure on infant growth. Two studies suggest an association between maternal lead exposure and decreased growth. In one study, maternal bone lead levels were negatively associated with infant weight at one month of age and with postnatal weight gain between birth and 1 month (Sanin et al. 2001). In another study, postnatal linear growth rate was negatively related to prenatal blood lead level, although only when infants' postnatal lead exposure was elevated (Shukla et al. 1989). Infants born to a mother with prenatal blood lead concentration greater than 7.7 µg/dL (the median level in the cohort) and whose blood lead increased 10 µg/dL between 3 and 15 months of age were about 2 cm shorter at 15 months of age ( $p = 0.01$ ). Greene and Ernhart (1991) also reported negative associations between prenatal lead level and birth weight, birth length, and head circumference, although none were statistically significant. Data on the association between prenatal lead exposure and infant growth is limited and thus inconclusive.

### Lead and Neurodevelopment

Neurotoxic effects of lead are observed during episodes of acute lead poisoning in both children and adults. It remains unclear, however, whether prenatal or postnatal lead exposure is more detrimental to neurodevelopment. A number of chemicals, including lead, have been shown, in experimental animal models as well as in humans, to cause morphological changes in the developing nervous system (Costa et al. 2004). Given the incomplete blood-brain barrier in the developing nervous system, children might be more susceptible to insults during the prenatal and early postnatal periods (Bearer 1995; Rodier 1995; Weiss and Landrigan 2000).

Animal research indicates that the central nervous system is the organ system most vulnerable to developmental chemical injury (Rodier 2004), with vulnerabilities that pertain to processes critical to neurodevelopment, such as the establishment of neuron numbers; migration of neurons; establishment of synaptic connections, neurotransmitter activity, receptor numbers; and deposition of myelin. Neurons begin forming even before the neural tube closes. Most cerebral neurons form during the second trimester of gestation and migrate to their adult location well before birth (Goldstein 1990). Neuronal connections, however, are sparse at birth compared to adulthood. During the first 24 months of life, synaptic density and cerebral metabolic rate increase dramatically and by age 3 years are two-fold greater than those in the adult. The proliferation of synapses (synaptogenesis) is critical for the formation of basic circuitry of the nervous system (Rodier 1995). Synaptic "pruning" during early childhood establishes the final number of neurons.

Lead is known to interfere with synaptogenesis and, perhaps, with pruning (Goldstein 1992). It interferes with stimulated neurotransmitter release at synapses in the cholinergic, dopaminergic, noradrenergic, and GABAergic systems (Cory-Slechta 1997; Guilarte et al. 1994). It substitutes for calcium and zinc as a second messenger in ion-dependent events. These disturbances in neurotransmitter release would thus be expected to disrupt the normal organization of synaptic connections (Bressler and Goldstein 1991).

The brain is protected from large molecular compounds in the blood by the blood-brain barrier, created by tight junctions between endothelial cells in cerebral blood vessels (Goldstein 1990). The development of this barrier function begins *in utero* and continues through the first year of life (Goldstein 1990). The brain is one of the target organs for lead and lead exposure *in utero* and the first year of life may disrupt the development of the blood-brain barrier.

These lead-induced biochemical disturbances in the brain are accompanied by impaired performance on a wide variety of tests of learning and memory in a variety of animal models and no threshold for these impairments has been identified (White et al. 2007).

## Epidemiologic Evidence for Neurodevelopmental Effects of Lead

A large number of studies provide convincing evidence that prenatal lead exposure impairs children's neurodevelopment (Table 2-1). In most of the early prospective studies, many children had prenatal exposures exceeding 10 µg/dL. Several studies reported significant inverse associations with neurobehavior (Bellinger et al. 1987; Dietrich et al. 1987a,b; Ernhart et al. 1987; Shen et al. 1998; Wasserman et al. 2000). One study found that the early developmental delays were largely overcome if postnatal lead exposures were low in the preschool years, but appeared to be more persistent among children whose postnatal blood lead levels were also greater than 10 µg/dL (Bellinger et al. 1990). Other studies found that the effects of prenatal exposure were independent of changes in postnatal blood lead levels (e.g., Wasserman et al. 2000). These inverse associations persisted into adolescence and beyond, as maternal blood lead levels during pregnancy predicted teenage attention and visuoconstruction abilities (Ris et al. 2004), teenage self-reported delinquent behaviors (Dietrich et al. 2001), and increased arrest rates between the ages of 19 and 24 (Wright et al. 2008). A relationship between prenatal blood lead levels and the onset of schizophrenia between the late teens and early 20s is also seen (Opler et al. 2004, 2008). Some studies, however, did not find evidence of prenatal lead effects (e.g., Baghurst et al. 1992; Bellinger et al. 1992; Cooney et al. 1989a, 1989b; Dietrich et al. 1990, 1993; Ernhart et al. 1989; McMichael et al. 1988).

More-recent prospective studies have included children with lower prenatal exposures, and continue to detect inverse associations with neurodevelopment. Wasserman et al. (2000) found independent adverse effects of both prenatal and postnatal blood lead on IQ among Yugoslavian children age 3-7 years. Prenatal lead exposure was associated with a deficit of 1.8 IQ points for every doubling of prenatal maternal blood lead after controlling for postnatal exposure and other covariates. In a study conducted in Mexico City, Gomaa et al. (2002) found that umbilical cord blood lead and maternal bone lead levels were independently associated with covariate-adjusted scores at 2 years of age on the Mental Development Index score of the Bayley Scales of Infant Development with no evidence of a threshold. Maternal blood lead level early in the second trimester and in the third trimester was a significant predictor for some measures of mental and psychomotor development at age 2 years (Wigg et al. 1988). In another study in Mexico City, maternal plasma lead level in the first trimester was a particularly strong predictor of neurodevelopment at age 2 years (Hu et al. 2006). When this cohort was assessed at 24 months, inclusion of umbilical cord blood lead level in the model indicated that it was a significant predictor of psychomotor development even when analyses were restricted to children whose lead levels never exceeded 10 µg/dL (Tellez-Rojo et al. 2006). Schnaas et al. (2006) found that prenatal lead exposure around 28-36 weeks gestation (third trimester) was a stronger predictor of reduced intellectual development at ages 6-10 years than second trimester (12-20 weeks) exposure, but that study did not measure prenatal exposure in the first trimester of pregnancy. Jedrychowski et al. (2008) found a higher risk of scoring in the high-risk group on the Fagan Test of Infant Intelligence at age 6 months when umbilical cord blood was higher. Low-level umbilical cord blood lead levels can also negatively impact responses to acute stress (Gump et al. 2008).

In another study conducted in Mexico City, third trimester increases in maternal blood lead levels were associated with decreased ability of newborns to self-quiet and be consoled during the first 30 days of life (Rothenberg et al. 1989). In addition, greater prenatal and perinatal lead exposure was associated with altered brain-stem auditory evoked responses (Rothenberg et al. 1994, 2000).

## Threshold Levels and Persistence of Effects

No threshold has been found for the adverse effects of lead on neurodevelopment (Centers for Disease Control and Prevention 2004). Recent evidence, in fact, suggests that the dose-effect relationship might be supra-linear, with steeper dose responses at levels below 10 µg/dL than above 10 µg/dL (Bellinger and Needleman 2003; Canfield et al. 2003; Jusko et al. 2008; Kordas et al. 2006; Lanphear et al. 2000; Tellez-Rojo et al. 2006). In the largest study of this issue, Lanphear et al. (2005) pooled data on 1,333 children who participated in seven

international population-based longitudinal cohort studies and were followed from birth or infancy until 5–10 years of age. Among children with a maximal blood lead level  $<7.5 \mu\text{g/dL}$ , the decline in full-scale IQ for a given increase in blood lead was significantly greater than the decline observed among children with a maximal level  $\geq 7.5 \mu\text{g/dL}$ . Nonlinear relationships were also detected in the Yugoslavia (Wasserman et al. 2000) and Mexico City (Schnaas et al. 2006) studies which suggest that the effects of prenatal exposure may also be more pronounced at blood lead levels less than  $10 \mu\text{g/dL}$ .

Evidence from several of the prospective studies suggests that the adverse effects of early childhood lead exposure on neurodevelopment persist into the second decade of life (Bellinger et al. 1992; Fergusson et al. 1997; Ris et al. 2004; Tong et al. 1996; Wasserman et al. 2000) and are unrelated to changes in later blood lead level (Burns et al. 1999; Tong et al. 1998;). Administration of the chelating agent succimer to children with blood lead levels of  $20\text{--}44 \mu\text{g/dL}$  did not prevent or reverse neurodevelopmental toxicity (Dietrich et al. 2004; Rogan et al. 2001).

### **Summary of the Evidence: Infant Growth and Neurodevelopment**

Data on the association between prenatal lead exposure and infant growth are limited and thus inconclusive. The findings of recent cohort studies offer suggest that prenatal lead exposure at maternal blood lead levels below  $10 \mu\text{g/dL}$  is inversely related to neurobehavioral development independent from the effects of postnatal exposure. While the lead-associated differences in test score are small when viewed as a potential change in an individual child's score, they acquire substantially greater importance when viewed as a shift in the mean score within a population (Bellinger 2004). The mechanism(s) by which low-level lead exposure, whether incurred prenatally or postnatally, might adversely affect neurobehavioral development remains uncertain, although experimental data support the involvement of many pathways.

Because there is no apparent threshold below which adverse effects of lead do not occur, CDC has not identified an allowable exposure level, level of concern, or any other bright line intended to connote a safe or unsafe level of exposure for either mother or fetus. Instead, CDC is applying public health principles of prevention to intervene when prudent. Specific recommendations are presented throughout the rest of these guidelines.

**Table 2-1. Summary of Studies Estimating Association of Prenatal Lead Exposure with Neurodevelopmental Effects**

Year	Study	Study Site	Study Type	N	Estimate of Prenatal Exposure Measured	Lead Levels (in µg/dL)	Outcome Measure(s)	Age at Outcome	Results
2008	Low-level prenatal and postnatal blood lead exposure and adrenocortical responses to acute stress in children (Gump et al. 2008)	Oswego, NY	Cohort study	154	Umbilical cord blood lead level (BLL)	Range: <1.0-6.3	Cortisol response to acute stress (the glucocorticoid product of hypothalamic-pituitary-adrenal (HPA) activation)	9.5 years	Relatively low prenatal blood lead levels, e.g., BLL <10 µg/dL, can alter adrenocortical response to acute stress.
2008	Prenatal low-level lead exposure and developmental delay of infants at age 6 months (Krakow inner city study) (Jedrychowski et al. 2008)	Krakow, Poland	Cohort study	452	Umbilical cord BLL	Mean cord BLL 1.42, 95% CI = 1.35-1.48	Fagan Test of Infant Intelligence (FII)	6 months	Estimated risk for scoring in high-risk group of developmental delay (FII classification 3) due to higher lead blood levels was two-fold greater (odds ratio [OR] = 2.33, 95% confidence interval [CI] = 1.32-4.11) than for lower lead blood levels after adjusting for potential confounders (gestational age, gender of the child, and maternal education).
2008	Prenatal exposure to lead, delta-aminolevulinic acid, and schizophrenia, further evidence (Opler et al. 2008)	Oakland, CA, Providence, RI, and Boston, MA	Pooled case control	200 (119 from Oakland, 81 from New England)	Maternal delta-ALA from second trimester frozen blood samples	Dichotomized to estimated (from delta-aminolevulinic acid [ALA]) maternal BLLs in 2nd trimester of $\geq 15$ or $<15$	Schizophrenia (includes schizophrenia, schizoaffective disorder, schizophrenia, schizotypal personality disorder, delusional disorder, and nonaffective psychoses not otherwise specified)	15-22 years (not included in this report, but from Opler et al. [2004])	OR for schizophrenia associated with exposure, corresponding to 15 µg/dL of blood lead was 1.92 (95% CI = 1.05-3.87, $p = 0.03$ ).

Year	Study	Study Site	Study Type	N	Estimate of Prenatal Exposure Measured	Lead Levels (in µg/dL)	Outcome Measure(s)	Age at Outcome	Results
2008	Association of prenatal and childhood blood lead concentrations with criminal arrests in early adulthood (Wright et al. 2006)	Cincinnati, OH	Cohort study	250	Maternal prenatal BLL at 1st or early 2nd trimester	Mean (standard deviation [SD]): BLL = 8.3 (3.8); Median 7.8 (5th to 95th percentile 2.9–16).	Number of criminal arrests since turning 18 years of age	19–24 years	Increased arrest rates associated with prenatal BLL, relative risk (RR) = 1.40 (95% CI = 1.07–1.85).
2006	Fetal lead exposure at each stage of pregnancy as a predictor of infant mental development (Hu et al. 2006)	Mexico City, Mexico	Cohort study	146	Maternal prenatal plasma lead	Plasma lead mean (SD): 1st trimester 0.016 (0.014), N = 119; 2nd trimester 0.014 (0.011), N = 136; 3rd trimester 0.016 (0.024), N = 132	Bayley Mental Development Index (MDI)	24 months	Single-trimester models of MDI scores suggested a negative relationship between prenatal lead and MDI at 24 months adjusting for covariates. Maternal plasma lead in 1st trimester most strongly associated with MDI ( $\beta = -4.13$ , $p = 0.03$ ).
2006	Fetal lead exposure at each stage of pregnancy as a predictor of infant mental development (Hu et al. 2006)	Mexico City, Mexico	Cohort study	146	Maternal prenatal BLL	BLL mean (SD): 1st trimester 7.1 (5.1), N = 119; 2nd trimester 6.1 (3.2), N = 136; 3rd trimester 6.9 (4.2), N = 132; delivery 7.3 (4.3), N = 111	Bayley MDI	24 months	Single-trimester models of MDI scores suggested a negative relationship between prenatal lead and MDI at 24 months adjusting for covariates. Maternal blood lead in 1st trimester most strongly associated with MDI ( $\beta = -3.77$ , $p = 0.03$ ).
2006	Fetal lead exposure at each stage of pregnancy as a predictor of infant mental development (Hu et al. 2006)	Mexico City, Mexico	Cohort study	146	Umbilical cord BLL	Umbilical cord lead (mean 6.2 SD 3.9) (for N = 83 only)	Bayley MDI	24 months	Umbilical cord blood lead was not statistically significantly associated with MDI ( $\beta = -0.35$ , $p = 0.88$ ), but this exposure measure was only available on a subset of subjects.

Year	Study	Study Site	Study Type	N	Estimate of Prenatal Exposure Measured	Lead Levels (in µg/dL)	Outcome Measure(s)	Age at Outcome	Results
2006	Reduced intellectual development in children with prenatal lead exposure (Schnaas et al. 2006)	Mexico City, Mexico	Cohort study	150	Maternal BLL (12-20 weeks)	Geometric mean 8.2; 3.0-20.7 5th-95th percentile	Full-scale IQ (FSIQ) as assessed using the Wechsler Intelligence Scale for Children-Revised (WISC-R; Spanish version) under standardized conditions	6-10 years	Multivariate regression analysis showed IQ reduction associated with BLL increase ( $\beta = -1.45$ , 95% CI = -4.75 to 2.00), but was not statistically significant ( $p = 0.42$ ).
2006	Reduced intellectual development in children with prenatal lead exposure (Schnaas et al. 2006)	Mexico City, Mexico	Cohort study	150	Maternal BLL (28-36 weeks)	Geometric mean 7.8; 2.5-24.6 5th-95th percentile	FSIQ as assessed using WISC-R; Spanish version under standardized conditions	6-10 years	Multivariate regression analysis showed IQ reduction associated with BLL increase ( $\beta = -4.00$ , 95% CI = -6.37 to -1.65) and was statistically significant ( $p = 0.001$ ).
2006	Reduced intellectual development in children with prenatal lead exposure (Schnaas et al. 2006)	Mexico City, Mexico	Cohort study	112	Maternal BLL (at delivery)	Not reported	FSIQ as assessed using WISC-R; Spanish version under standardized conditions	6-10 years	Multivariate regression analysis showed IQ reduction associated with BLL increase ( $\beta = -1.29$ , 95% CI = -4.41 to 1.83) but was not statistically significant ( $p = 0.41$ ).
2006	Reduced intellectual development in children with prenatal lead exposure (Schnaas et al. 2006)	Mexico City, Mexico	Cohort study	109	Umbilical cord BLL	Not reported	FSIQ as assessed using WISC-R; Spanish version under standardized conditions	6-10 years	Multivariate regression analysis showed IQ reduction associated with BLL increase ( $\beta = -0.95$ , 95% CI = -3.65 to 1.75) but was not statistically significant ( $p = 0.49$ ).

Year	Study	Study Site	Study Type	N	Estimate of Prenatal Exposure Measured	Lead Levels (in µg/dL)	Outcome Measure(s)	Age at Outcome	Results
2004	Prenatal lead exposure, delta-aminolevulinic acid, and schizophrenia (Opler et al. 2004)	Oakland, CA	Nested case control	119	Maternal delta-ALA from 2nd trimester frozen blood samples	Dichotomized to estimated (from delta-ALA) maternal BLLs in 2nd trimester of $\geq 15$ and $< 15$	Schizophrenia (includes schizophrenia, schizoaffective disorder, schizophrenia, schizotypal personality disorder, delusional disorder, and nonaffective psychoses not otherwise specified)	15-22 years	OR for schizophrenia associated with exposure, corresponding to 15 µg/dL of blood lead was 2.43 (95% CI = 0.99-5.96; $p = 0.051$ ).
2004	Early exposure to lead and neuropsychological outcome in adolescence (Ris et al. 2004)	Cincinnati, OH	Prospective cohort study	195	Prenatal maternal BLL	Mean BLL 4-35	Neuropsychological measures: memory, learning/IQ, attention, visuoconstruction, and fine-motor	15-17 years	Prenatal BLL associated with decreased neuropsychological measures in the attention and visuoconstruction domains at mid-adolescence.
2002	Maternal bone lead as an independent risk factor of fetal neurotoxicity: a prospective study (Gomaa et al. 2002)	Mexico City, Mexico	Prospective cohort study	197	Maternal tibia bone lead 1 month after delivery (cortical bone)	Mean 11.5, SD 11.0, range $< 1-85.9$	MDI and Psychomotor Development Index (PDI) scores as assessed using the Bayley Scales of Infant (Development II) (BSID-II; Spanish version)	24 months	Higher tibia lead levels were associated with lower MDI scores, but this association was not statistically significant.
2002	Maternal bone lead as an independent risk factor of fetal neurotoxicity: a prospective study (Gomaa et al. 2002)	Mexico City, Mexico	Prospective cohort study	197	Maternal patella bone lead 1 month after delivery (trabecular bone)	Mean 17.9, SD 5.2, range $< 1-76.6$	MDI and PDI scores as assessed using BSID-II; Spanish version	24 months	In relation to the lowest quartile of trabecular bone lead, the 2nd, 3rd, and 4th quartiles were associated with 5.4 ( $p = 0.05$ ), 7.2 ( $p = 0.01$ ) and 6.5 ( $p = 0.02$ ) point decrements in adjusted MDI scores, respectively.

Year	Study	Study Site	Study Type	N	Estimate of Prenatal Exposure Measured	Lead Levels (in µg/dL)	Outcome Measure(s)	Age at Outcome	Results
2002	Maternal bone lead as an independent risk factor of fetal neurotoxicity: a prospective study (Gomaa et al. 2002)	Mexico City, Mexico	Prospective cohort study	197	Umbilical cord BLL	Mean 6.7, SD 3.4, range 1.2 to 21.6	MDI and PDI scores as assessed using BSID-II; Spanish version	24 months	A 2-fold increase in cord blood lead level was associated with a 3.1-point decrement in MDI score
2001	Early exposure to lead and juvenile delinquency (Dietrich et al. 2001)	Cincinnati, OH	Prospective cohort study	157	Prenatal BLL (end of 1st trimester)	Mean 8.9, SD 3.9, range was not reported	Delinquency	15-17 years	Prenatal exposure to lead was significantly associated with a covariate-adjusted increase in the frequency of parent-reported delinquent and antisocial behaviors ( $\beta = 0.194$ , SE = 0.089, Partial $r^2 = 0.045$ , $p = 0.032$ ), and with a covariate-adjusted increase in frequency of self-reported delinquent and antisocial behaviors. Partial $r^2 = (\beta = 0.192$ , SE = 0.076, 0.049, $p = 0.002$ ).
2000	Brainstem auditory evoked response at five years and prenatal and postnatal blood lead (Rothenberg et al. 2000)	Mexico City, Mexico	Prospective cohort study	100	Maternal BLL (20 weeks)	Abstract: geometric mean 7.7; range 1-30.5. Table, with BAER Geometric mean 8.1 SD +8.1/-4.0	Brainstem auditory evoked response (BAER) interval	BAER: 5 years	Using multiple linear regression, both conduction intervals I-V and III-V had significant or marginally significant relationships with 20-week maternal blood lead level. The nonlinear model showed I-V and III-V interpeak intervals decreased as 20-week blood lead rose from 1 to 8 µg/dL, and then increased as blood lead rose from 8 to 30.5 µg/dL.

Year	Study	Study Site	Study Type	N	Estimate of Prenatal Exposure Measured	Lead Levels (in µg/dL)	Outcome Measure(s)	Age at Outcome	Results
2000	The Yugoslavia prospective lead study: contributions of prenatal and postnatal lead exposure to early intelligence (Wasserman et al. 2000)	Mitrovica and Pristina, Yugoslavia	Prospective cohort study	390	Maternal BLL (mid-pregnancy)	Means: exposed 18.2; controls 5.25	Early intelligence as assessed by McCarthy GCI (ages 3 and 4); Wechsler Preschool and Primary Scale of Intelligence-Revised (WPPSI-R IQ) (age 5); Wechsler Intelligence Scale for Children-version III (WISC-III IQ) (age 7)	3-5, 7 years	With adjustment for covariates, a significant decrement was detected: 6.05 points in IQ for each log unit increase in prenatal BLL (SE 1.35, $p < 0.001$ ). A 50% rise in prenatal BLL was associated with a 1.07 point decrement in IQ (95% CI = 0.60, 1.53). The association between prenatal BLL and IQ is not linear; the strongest postnatal effects are noted at the lower levels of prenatal exposure.
2000	The Yugoslavia prospective lead study: contributions of prenatal and postnatal lead exposure to early intelligence (Wasserman et al. 2000)	Mitrovica and Pristina, Yugoslavia	Prospective cohort study	390	Prenatal (average of mother's log10 BLL at mid-pregnancy and at delivery)	Means: exposed 19.5; controls 5.13	Early intelligence as assessed by McCarthy GCI (ages 3 and 4); WPPSI-R IQ (age 5); WISC-III IQ (age 7)	3-5, 7 years	With adjustment for covariates, a significant decrement was detected: 6.05 points in IQ for each log unit increase in prenatal BLL (SE 1.35, $p < 0.001$ ). A 50% rise in prenatal BLL was associated with a 1.07 point decrement in IQ (95% CI = 0.60, 1.53). The association between prenatal BLL and IQ is not linear; the strongest postnatal effects are noted at the lower levels of prenatal exposure.
2000	The Yugoslavia prospective lead study: contributions of prenatal and postnatal lead exposure to early intelligence (Wasserman et al. 2000)	Mitrovica and Pristina, Yugoslavia	Prospective cohort study	390	Umbilical cord BLL	Means: exposed 20.4; controls 5.01	Early intelligence as assessed by McCarthy GCI (ages 3 and 4); WPPSI-R IQ (age 5); WISC-III IQ (age 7)	3-5, 7 years	With adjustment for covariates, a significant decrement was detected: 6.05 points in IQ for each log unit increase in prenatal BLL (SE 1.35, $p < 0.001$ ). A 50% rise in prenatal BLL was associated with a 1.07 point decrement in IQ (95% CI = 0.60, 1.53). The association between prenatal BLL and IQ is not linear; the strongest postnatal effects are noted at the lower levels of prenatal exposure.

Year	Study	Study Site	Study Type	N	Estimate of Prenatal Exposure Measured	Lead Levels (in µg/dL)	Outcome Measure(s)	Age at Outcome	Results
1998	Low-level prenatal lead exposure and neurobehavioral development of children in the first year of life: a prospective study in Shanghai (Shen et al. 1998)	Shanghai, China	Prospective cohort study	133	Umbilical cord BLL	Geometric mean: 9.2, range 1.6 to 17.5, 95% CI = 8.86 to 9.54. High lead group mean 13.4, SD 2.0; Low lead group mean 5.3, SD 1.4	Child development as assessed by the MDI and PDI of the Bayley Scales of Infant Development	3, 6, and 12 months	At all three ages, after controlling for confounders, the MDI scores were inversely related to the infants' cord blood lead levels (at 3, 6, 12 months, $p = 0.0187$ , $0.0315$ , and $0.0279$ , respectively); however, no significant association between cord blood lead levels and the PDI scores was detected.
1994	Prenatal and perinatal low level lead exposure alters brainstem auditory evoked responses in infants (Rothenberg et al. 1994)	Mexico City, Mexico	Prospective cohort study	25-29	Maternal BLL (12, 20, 28, 36 weeks)	Not reported	Infant BAER	Median: 9 days (range 2-39 days), 3 months	For neonates, the I-V interpeak interval is increased with increasing maternal BLL at 12 weeks. Latencies of peaks I and III are decreased with increasing maternal BLL at 20 weeks, and the III-V interpeak interval is increased with increasing maternal BLL at 20 weeks. The III-V interpeak interval is increased with increasing maternal BLL at 28 and 36 weeks. At 3 months, maternal BLL at 20 and 36 weeks were associated with increased III-IV interpeak intervals. These findings are statistically significant ( $p < 0.1$ ). Infant spatial localization of sound may be compromised by mid-pregnancy lead exposure.

Year	Study	Study Site	Study Type	N	Estimate of Prenatal Exposure Measured	Lead Levels (in µg/dL)	Outcome Measure(s)	Age at Outcome	Results
1994	Prenatal and perinatal low level lead exposure alters brainstem auditory evoked responses in infants (Rothenberg et al. 1994)	Mexico City, Mexico	Prospective cohort study	25	Maternal BLL (at delivery)	Not reported	Infant BAER	Median: 9 days (range 2-39 days)	The III-V interpeak interval is increased with increasing maternal BLL at delivery. This finding is statistically significant ( $p < 0.1$ ). Infant spatial localization of sound may be compromised by prenatal mid-pregnancy lead exposure.
1994	Prenatal and perinatal low level lead exposure alters brainstem auditory evoked responses in infants (Rothenberg et al. 1994)	Mexico City, Mexico	Prospective cohort study	27	Umbilical cord BLL	Not reported	Infant BAER	Median: 9 days (range 2-39 days); 3 months	For neonates, the III-V interpeak interval is increased with increasing cord BLL. At 3 months, cord BLL was associated with increased III-IV interpeak intervals. These findings are statistically significant ( $p < 0.1$ ). Infant spatial localization of sound may be compromised by prenatal mid-pregnancy lead exposure.
1993	The developmental consequences of low to moderate prenatal and postnatal lead exposure: Intellectual attainment in the Cincinnati lead study cohort following school entry (Dietrich et al. 1993)	Cincinnati, OH	Prospective cohort study	217	Maternal BLL (end of 1st trimester)	Mean 8.3, SD 3.7	Full Scale IQ (FSIQ), Performance IQ (PIQ), and Verbal IQ (VIQ) as assessed by WISC-R	6.5 years	Covariate-adjusted regression coefficients for BPb indices and the Wechsler scales demonstrated that PreBPb was unrelated to intellectual attainment at 6.5 years (FSIQ: $\beta = 0.15$ , SE 0.21; PIQ $\beta = 0.06$ , SE 0.23; VIQ: $\beta = 0.16$ , SE 0.21; all $p > 0.1$ ).
1992	Environmental exposure to lead and children's intelligence at the age of seven years, the Port Pirie study (Baghurst et al. 1992)	Port Pirie, Australia	Prospective cohort study	494	Maternal BLL (average antenatal)	Geometric mean concentrations by quartile: I 6.2 (low); II 8.7; III 10.6; IV 14.3 (high)	IQ as measured by WISC-R	7 years (median age: 186 days after 7th birthday)	Inverse relationship between full-scale IQ at age 7 years and antenatal BLLs (unadjusted), but not statistically significant after adjustment for multiple covariates ( $\beta = -1.4$ , SE 2.0, $p = 0.48$ ).

Year	Study	Study Site	Study Type	N	Estimate of Prenatal Exposure Measured	Lead Levels (in µg/dL)	Outcome Measure(s)	Age at Outcome	Results
1992	Environmental exposure to lead and children's intelligence at the age of seven years: the Port Pirie study (Baghurst et al. 1992)	Port Pirie, Australia	Prospective cohort study	494	Umbilical cord BLL	Geometric mean concentrations by quartile: I 4.3 (low); II 7.4; III 9.9; IV 15.0 (high); overall mean 8.9	IQ as measured by WISC-R	7 years (median age: 186 days after 7th birthday)	Inverse relationship between full-scale IQ at age 7 years and cord BLLs (unadjusted), but not statistically significant after adjustment for multiple covariates ( $\beta = 0.6$ , SE 1.4, $p = 0.68$ ).
1992	Low level lead exposure, intelligence and academic achievement: a long-term follow-up study (Bellinger et al. 1992)	Boston, MA	Prospective cohort study	148	Umbilical cord BLL	Categorized into: low <3; medium 6-7; high $\geq 10$ ; no mean, SD, range given	WISC-R and the Kaufman Test of Educational Achievement (K-TEA)	10 years	Cord BLL was inversely associated with crude full-scale IQ (low: $\beta = -1.29$ , SD 3.03; medium $\beta = -1.52$ , SD 3.01 (high: $\beta = 1.01$ ; $p = 0.86$ ), and with adjusted full-scale IQ (low: $\beta = -0.48$ , SD 2.65; medium 2.55 $\beta = -2.56$ , SD (high: $\beta = 1.0$ ); $p = 0.57$ ), but the association failed to meet statistical significance.
1990	Antecedents and correlates of improved cognitive performance in children exposed in utero to low levels of lead (Bellinger et al. 1990)	Boston, MA	Prospective cohort study	170	Umbilical cord BLL	Categorized into: low <3; medium 6-7; high $\geq 10$ ; no mean, SD, range given	Cognitive function as assessed by MDI scores from the Bayley Scales of Infant Development at age 2 and by GCI score from the McCarthy Scales of Children's Abilities at 57 months	24 months (median age) 57.8 months (median age)	Elevated prenatal lead is associated with lower MDI scores at 2 years old. Recovery from 2 to 5 years of age is modified by sociodemographic factors and BLL at 2 years.
1990	Lead exposure and neurobehavioral development in later infancy (Dietrich et al. 1990)	Cincinnati, OH	Prospective cohort study	237	Maternal BLL (50% first trimester, 49% 2nd trimester, 1% 3rd trimester)	Mean 8.0, SD 3.7, Range 1-27	Behavioral development as assessed by Bayley MDI	24 months	No statistically significant relationships between prenatal blood lead variables and Bayley MDI were found.

**Key Points**

- No single test is available to establish total body lead burden; biological markers (biomarkers) must be used to estimate maternal lead body burden and to assess lead dose to the fetus or infant during pregnancy or breastfeeding.
- Blood lead is the most well-validated and widely available measure of lead exposure. However, a single blood lead test may not reflect cumulative lead exposure and may not be sufficient to establish the full nature of the developmental risk to the fetus/infant. Repeat testing may be necessary.
- Bone is a potential endogenous source of lead exposure and studies have demonstrated that some of the previously acquired maternal bone lead stores are mobilized during pregnancy and lactation. However, bone lead measurement is almost exclusively a research tool.
- Lead readily crosses the placenta by passive diffusion and has been measured in the fetal brain as early as the end of the first trimester, so primary prevention of exposure is particularly important to reduce risk.
- Lead has been detected in the breast milk of women in population-based studies; however, the availability of high-quality data to assess the risk for toxicity to the breastfeeding infant is limited.
- Given the difficulty of accurately and precisely measuring trace amounts of lead in human breast milk, routine measurement of breast milk lead is not warranted for routine clinical application at this time.

**INTRODUCTION**

The purpose of this chapter is to discuss biological markers (biomarkers) that have been proposed to assess lead body burden and to summarize our present understanding of the biokinetics of lead during pregnancy and lactation. There is no single test available to establish total body lead burden, since lead may be in all body fluids and tissues including bone. Biomarkers must be used to estimate lead body burden and to assess lead dose to the fetus during pregnancy and to the infant during lactation. Figure 3-1 shows the major lead exposure pathways from mother to infant.

**BIOLOGICAL MARKERS OF LEAD EXPOSURE**

Certain biomarkers of lead dose to the fetus during pregnancy have been validated as measures of exposure. These include measurement of lead collected from maternal venous blood during pregnancy and umbilical cord blood at delivery, and measurement of lead in maternal bone using the noninvasive technique of K-x-ray fluorescence (Hu and Hernandez-Avila 2002). Each of these biomarkers provides an independent level of information regarding fetal lead exposure; together, they are critical to understanding whether lead toxicity varies based on timing of exposure, cumulative versus acute dose, and partitioning of lead between red cells and plasma (Hu and Hernandez-Avila 2002; Tellez-Rojo et al. 2004).

Variability in individual blood lead levels and limitations in the accuracy of measurement techniques including limits of detection, rounding, analytical methods, and regression to the mean pose challenges to reliable

assessment of blood lead levels, particularly when blood lead levels are low. Laboratory instruments introduce measurement error, as do certain blood lead sampling methods (e.g., capillary samples may be prone to contamination due to lead dust on the skin surface). Venous blood lead tests produce the most reliable results. Capillary samples have a high level of sensitivity but lower specificity and may produce a higher number of false positives.

Other biomarkers have been used or proposed, usually because of the relative ease and noninvasiveness of collection procedures. These include hair, nails, teeth, saliva, urine, feces, meconium, placenta, and sperm. However, the utility of these alternatives as biomarkers for internal dose has not been demonstrated. In addition to the absence of consistent, validated analytic methods and standard reference materials for these biomarkers, they would also have to overcome the challenge of external contamination (Barbosa et al. 2005).

### **Whole Blood Lead**

Blood lead has been the most commonly used and readily available biomarker of exposure to date with standard units of measurement in micrograms per deciliter ( $1 \mu\text{g}/\text{dL} = 0.0484 \mu\text{mol}/\text{L}$ ). Following removal of the subject from environmental exposure, the decline in blood lead concentration occurs relatively rapidly at first; the initial half-life of lead in blood is about 35 days (Rabinowitz et al. 1976). This initial rapid drop is followed by a slow continuing decline over several months to years. In addition to lead from exogenous sources, blood lead represents the contribution of past environmental exposure being mobilized from endogenous bone stores. It is this reservoir of lead that determines the slow decline in blood lead after the first few weeks following removal from exposure.

Umbilical cord whole blood lead collected at delivery has been widely used as a measure of fetal exposure (Harville et al. 2005; Satin et al. 1991; Scanlon 1971; Rothenberg et al. 1996;). Lead readily crosses the placenta by passive diffusion (Goyer 1990; Silbergeld 1986) and fetal blood lead concentration is highly correlated with maternal blood lead concentration (Goyer 1990).

However, a single blood lead test may not reflect cumulative lead exposure and may not be sufficient to establish the full nature of the developmental risk to the fetus/infant. Physiologic changes, such as decreasing hematocrit, saturation of red cell lead-binding capacity, and increased bone resorption or intestinal absorption of lead, may influence the interpretation of blood lead levels during pregnancy. In addition, it is well known from the experimental literature that the vulnerability of developing organ systems, including the brain, to environmental toxicants can vary widely over the course of pregnancy (Mendola 2002). Thus, it is plausible that lead exposure may be particularly neurotoxic during a specific trimester (Hu et al. 2006; Schnaas et al. 2006).

### **Plasma Lead**

The overwhelming majority of lead in blood is bound to erythrocytes (DeSilva 1981), but plasma is the blood compartment from which lead is available to cross cell membranes (Cavalleri et al. 1978). An understanding of how plasma lead concentration is related to whole blood lead concentration is important. Plasma lead concentrations in the range of 0.1%-5.0% of whole blood lead concentration have been reported (DeSilva 1981; Manton and Cook 1984; Ong et al. 1986). Although whole blood lead levels are highly correlated with plasma lead levels, lead levels in bone and other tissues (particularly trabecular bone) exert an additional independent influence on plasma lead levels (Hernandez-Avila et al. 1998). Recent data suggest that the plasma-to-whole blood lead ratio may vary quite widely among and within individuals (Hu 1998; Lamadrid-Figueroa et al. 2006), raising questions about the use of maternal whole blood lead as a proxy for plasma lead and fetal exposure (Chuang et al. 2001; Goyer 1990; Hu et al. 2006).

However, the measurement of maternal plasma lead is not likely to become a clinically useful tool. The methods required to measure plasma lead accurately are laborious and require specialized equipment and ultra-clean techniques (Smith et al. 1998). Moreover, recent data suggest that the gain in using measurements of plasma lead during pregnancy to predict fetal/infant outcomes is only modest (Hu et al. 2006). Consequently,

this biomarker may be a useful research tool in efforts to understand and detect the health impacts of environmental lead exposure, but cannot be recommended at this time as a clinical tool.

### **Bone Lead**

Bone is a dynamic reservoir for lead, in constant exchange with blood and soft tissue elements (Rabinowitz 1991; Tsaih et al. 1999). Lead is incorporated into the hydroxyapatite crystalline structure of bone, much like calcium, and may also transfer into bone matrix exclusive of incorporation into hydroxyapatite (Marcus 1985). Because over 90% of lead in the adult human body is stored in bone (Barry 1975; Barry and Mossman 1970), there is the possibility of redistribution of cumulative lead stores from bone into blood during periods of heightened bone turnover, such as pregnancy and lactation (Roberts and Silbergeld 1995). Lead in bone has a half-life of years to decades and therefore reflects cumulative lead exposure (Hu et al. 1998). Measurement of lead in bone using a noninvasive, in vivo X-ray fluorescence (XRF) technique makes epidemiologic evaluation of the impact of retained body burden of lead possible (Hu 1998).

The amount of lead in bone depends on the individual's lead exposure history. Smith et al. (1996) determined that bone contributed 40%-70% of the lead in blood of environmentally exposed subjects who were undergoing total hip or knee joint replacement, indicating that the skeleton can be an important endogenous source of lead exposure. By examining the lead isotopic ratio in a small number of pregnant women who were recent immigrants to Australia (and pregnant Australian controls), Gulson and his colleagues (1997) were able to show that the skeletal contribution to maternal blood lead increased during pregnancy and lactation. Lead in maternal diet and bone lead were the main contributors to circulating maternal blood lead levels (Gulson 1998a). The relative contribution of bone lead to blood lead will vary depending on the exposure history of the individuals.

The measurement of bone lead requires special equipment and trained operators and is used mainly in research settings. Therefore, it is unlikely that this method will have widespread clinical application. However, this biomarker is a useful tool in research efforts to understand and detect the health impacts of cumulative lead exposure.

### **Breast Milk Lead**

Detectable levels of lead in breast milk have been documented in population studies of community-dwelling women with no known source of occupational or elevated environmental lead exposure (Abadin et al. 1997; Anderson and Wolff 2000). Given the correlation of breast milk lead levels with maternal and infant blood lead levels (Ettinger et al. 2004a, 2004b), milk lead can be used as an indicator of both maternal and neonatal exposures (Hallén et al. 1995). In studies of lead in human breast milk, concentrations have been observed ranging over three levels of magnitude, from <1 to greater than 100 µg/L (ppb) (Chatranon et al. 1978; Ettinger et al. 2004a; Gulson et al. 1997; Larsson et al. 1981; Murthy and Rhea 1971; Namihira et al. 1993). These differences are partially attributable to true differences in population exposures across time and geographic location (Solomon and Weiss 2002). However, it is also likely that a variety of methodological factors affect the analytic variability and validity of the reported results. Breast milk lead levels from published studies with extremely high values should be reviewed with caution due to the high potential for environmental contamination during sample collection, storage, and analysis. Documented sources of breast milk contamination include the use of lead acetate ointment (Knowles 1974), lead in nipple shields (Knowles 1974; Newman 1997), foil from alcohol wipes used in sample collection (Hu et al. 1996), and latex laboratory gloves (Friel et al. 1996). Pretreatment of biological materials is also subject to unintentional addition of contaminants from chemical reagents, digestion devices, and atmospheric particles (Coni et al. 1990; Stacchini et al. 1989).

Inaccuracies of the laboratory analytic methods, particularly poor analytic sensitivity at low concentrations, also affect measurement of trace lead in human milk. Measurement of lead in breast milk is complicated by the fat content of human milk, which changes during feeding and over the course of lactation (Sim and McNeil 1992). Any partitioning of lead into the fat layer of milk must be accounted for in the analysis, which leads to

the problem of either further contamination or loss during the intensive dry ashing procedure frequently used to prepare milk samples for analysis. Precise and accurate analysis is challenging due to difficulty in identifying a method that will digest samples with 100% efficiency (Ettinger et al. 2004a, 2004b). Gulson et al. (1998b) reviewed and compared the results of a number of studies of the relationship of breast milk lead to maternal blood lead published over the past 15 years, and concluded that the line of best fit through the data “that are considered to represent the realistic relationships between lead in maternal blood and breast milk” defines an array of slope of less than 3%. The implication is that those studies yielding ratios greater than 3% suffered from significant contamination.

Given the difficulty of accurately and precisely measuring trace lead in human breast milk, routine measurement of breast milk lead is not warranted for clinical application. It will only be practical in research settings or in certain extenuating circumstances, assuming that a qualified laboratory can be identified.

## **BIOKINETICS OF LEAD DURING PREGNANCY**

### **Changes in Maternal Blood Lead Levels During Pregnancy**

There are several case reports of elevated blood lead measurements in pregnancy (Mayer-Popken et al. 1986; Rothenberg et al. 1992; Ryu et al. 1978; Shannon 2003). Most cross-sectional studies investigating blood lead levels during pregnancy have shown a tendency for blood lead levels to decrease at least through the first half of pregnancy (Alexander and Delves 1981; Bonithon-Kopp et al. 1986; Gershanik et al. 1974). Baghurst (1987) found no difference in BLLs between different stages of pregnancy (weeks 14-20, weeks 30-36, and delivery). However, Farias et al. (1996) found BLLs were associated with gestational week of measurement, with levels declining after week 12.

Rothenberg et al. (1994), attempting to model kinetics over the course of pregnancy, showed a significant drop in blood lead levels from weeks 12 to 20. However, from 20 weeks to delivery, an analysis for linear trend confirmed a significant increase in blood lead levels in the later part of pregnancy. Schell et al. (2000) also reported changes in hematocrit-corrected blood lead levels over the course of pregnancy. Blood lead levels declined between the first and second trimesters and increased over the remaining course of pregnancy through delivery. Hertz-Picciotto et al. (2000) followed 195 women over the course of pregnancy and also found a U-shaped pattern of maternal blood lead concentration across pregnancy. The late pregnancy increases were steeper among women with low dietary calcium intake in both the younger and older age groups. Most recently, Lamadrid-Figueroa and colleagues (2006) found increased plasma lead levels for a given whole-blood lead value as pregnancy progresses for whole-blood lead levels greater than approximately 11.0 µg/dL, but not for those less than 10.0 µg/dL.

### **Transfer of Lead to the Fetus**

That lead reaches human fetal tissues has been known for many years (Barltrop 1969; Kehoe et al. 1933; Thompsett and Anderson 1935). Barltrop (1969) collected serial fetal blood lead measurements from each trimester throughout pregnancy and found no recognizable pattern but was able to show that maternal blood lead concentration was highly correlated with umbilical cord lead, suggesting transplacental movement of lead to the fetus. In fact, lead readily crosses the placenta by passive diffusion (Goyer 1990; Silbergeld 1986) and lead has been measured in the fetal brain as early as the end of the first trimester (13 weeks) (Goyer 1990).

### **Bone Lead as an Endogenous Source of Exposure**

Two early studies implicated bone lead as an endogenous source of exposure during pregnancy. Thompson et al. (1985) documented a case of increased maternal and infant blood lead in a woman with a history of childhood lead poisoning, but no exposure during pregnancy or for 30 years prior. Manton (1985) reported a rise in his wife's blood lead levels over the course of her pregnancy along with changes in the specific lead-isotopic ratios, indicating that contributions to her blood lead during pregnancy did not correspond to an external source.

Recent studies have documented that bone lead stores are mobilized during pregnancy and lactation (Gulson et al. 1997; Hernandez-Avila et al. 1996; Hu et al. 1996; Rothenberg et al. 2000). By examining the lead isotopic ratio in a small number of pregnant women who were recent immigrants to Australia (and pregnant Australian controls), Gulson and colleagues (1997) were able to show that the skeletal contribution to blood lead increased over pregnancy. Rothenberg et al. (2000) followed over 300 Hispanic-American women with serial blood lead levels over the course of pregnancy and found that whole blood lead concentrations were significantly influenced by bone lead. Markowitz and Shen (2001) reported a case of declining bone lead concentration in conjunction with an increase in blood lead levels over the course of pregnancy and the early postpartum period. Riess and Halm (2007) described a case report suggesting that bone sources at high levels can lead to an increase in BLL.

Animal studies support the human data. Using stable lead isotopes in monkeys, researchers found that a 29%-56% decrease in bone lead mobilization in the first trimester was followed by an increase in the second and third trimesters (Franklin et al. 1997). The increases were up to 44% over baseline levels. Further analysis of maternal bone and fetal bone and tissues revealed that from 7%-39% of lead in the fetal skeleton originated from maternal bone.

### **BIOKINETICS OF LEAD DURING LACTATION**

Maternal bone turnover increases during lactation (Sowers et al. 2002), which has raised the concern that maternal blood lead concentrations might increase significantly during lactation. It has been estimated that up to 5% or more of bone mass is mobilized during lactation (Hayslip et al. 1989; Sowers 1996); therefore, the possibility exists for redistribution of cumulative lead stores from bone into plasma, thus returning lead to the maternal circulation.

Gulson et al. (1998a) found that mobilization of lead from bone continued after pregnancy into the postpartum period for up to 6 months during lactation and occurred at levels higher than during pregnancy. They concluded that the major sources of lead in breast milk were maternal bone and diet. Manton et al. (2003) observed sustained elevations of from 1 to 4  $\mu\text{g}/\text{dL}$  in maternal blood lead concentration during the first 6 to 8 months of lactation, after the expected normal postpartum reduction in plasma volume, in 6 nursing mothers with prepregnancy blood lead concentrations of less than 2  $\mu\text{g}/\text{dL}$ . These elevations were followed by gradual declines over the next year in the two women who continued to breastfeed to 18 months postpartum. Isotope ratio analysis suggested that the additional lead originated from maternal bone.

Osterloh and Kelly (1999) found no relationship between decreasing vertebral or femoral neck bone densities and the changes in maternal blood lead concentration at intervals over 6 months of lactation in 58 mainly poor Hispanic mothers with low mean blood lead concentrations of 2.35  $\mu\text{g}/\text{dL}$  at enrollment in the study (32 to 38 weeks of gestation). However, at higher blood concentrations, Téllez-Rojo et al. (2002) observed an incremental increase of 1.4  $\mu\text{g}/\text{dL}$  in blood lead concentration in women who were breastfeeding exclusively relative to women who had stopped lactation. These women had blood lead concentrations up to 23.4  $\mu\text{g}/\text{dL}$  at delivery and were followed through 7 months postpartum. Bonithon-Kopp et al. (1986) found that women over 30 had significantly higher levels of breast milk lead than women between 20 and 30 years of age. Since bone accumulates lead with age, it is possible that the higher breast milk lead levels in the older women were associated with higher bone lead levels. Maternal bone lead levels have since been shown to be positively associated with breast milk lead concentrations (Ettinger et al. 2004a, 2006).

### **PREDICTORS OF UMBILICAL CORD BLOOD LEAD LEVELS**

Umbilical cord blood lead has been widely used as a measure of fetal exposure (Rabinowitz et al. 1984; Rothenberg et al. 1996; Scanlon 1971). Numerous studies suggest that maternal blood lead and umbilical cord lead levels, measured concurrently at delivery, are highly correlated (Baghurst et al. 1991; Graziano et al. 1990;

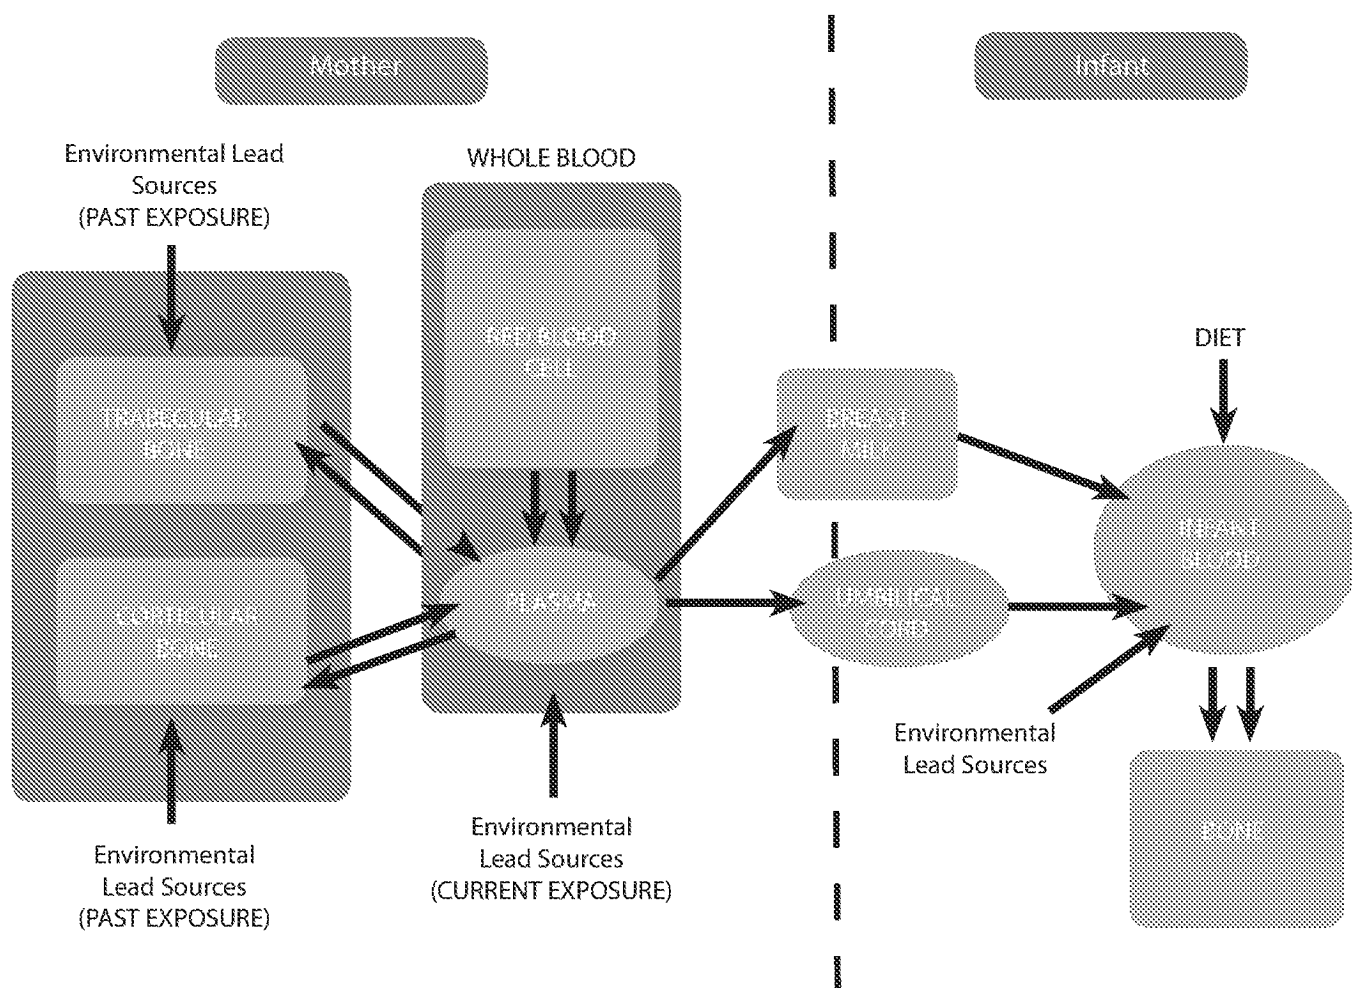

Harville et al. 2005; Rothenberg et al. 1996), suggesting a near-perfect linear relationship. Most data indicate that umbilical cord lead is approximately 0.85 of maternal blood lead at parturition (Carbonne et al. 1998; Goyer 1990; Graziano et al. 1990). Thus, fetal-infant lead level, as measured in umbilical cord blood, is often lower than the maternal blood lead at delivery. However, some studies have shown umbilical cord lead to be higher than maternal blood lead levels at delivery and investigated the determinants for such differences (Harville et al. 2005; Rothenberg et al. 1996).

Rothenberg et al. (1996) studied Mexican women of low-to-middle socioeconomic status from 12 weeks of pregnancy to delivery to determine factors that explain the relationship between cord and maternal blood lead. They found from 245 paired maternal-cord blood lead samples that mothers with occasional alcohol use during pregnancy, high milk intake, and more spontaneous abortions delivered babies with lower cord blood lead and that maternal age, use of lead-glazed pottery, and canned foods was associated with increased cord blood lead. They found cord blood lead levels were higher than maternal blood lead levels at delivery in 33% of the cases, predominantly influenced by older maternal age and lower milk consumption. The authors suggested that the measurable influence of maternal blood lead on delivery cord blood lead is limited to the four to eight weeks prior to delivery. Also, many factors suspected of influencing bone lead also influenced cord blood lead, some of them independently of their effect on maternal delivery blood lead.

Harville et al. (2005) studied factors influencing the difference between maternal and cord blood lead levels to determine why some infants receive higher exposures relative to their mother's body burden than do others. They found that higher maternal blood pressure and alcohol consumption were associated with higher cord lead relative to the lead of the mother. Higher maternal hemoglobin and presence of the sickle cell trait were associated with lower cord blood lead in comparison to mother's blood lead, suggesting that iron status may be an important factor in the maternal-fetal transfer of lead across the placenta.

Chuang et al. (2001) modeled the interrelations of lead levels in bone, venous blood, and umbilical cord blood with exogenous lead exposure through maternal plasma lead in peripartum women. An interquartile range increase in either patella (trabecular) or tibia (cortical) bone lead was associated with an increase in cord blood lead by about 1  $\mu\text{g}/\text{dL}$ . An increase of 0.1  $\mu\text{g}/\text{m}^3$  in air lead was associated with an increase in the mean level of fetal cord blood lead by 0.67  $\mu\text{g}/\text{dL}$ . With 1 additional day of lead-glazed ceramic use per week in the peripartum period, the mean cord blood lead level increased by 0.27  $\mu\text{g}/\text{dL}$ . The models suggested that the contributions from endogenous (bone) and exogenous (environmental) sources were relatively equal, and that maternal plasma lead varies independently from maternal whole blood lead.

**Figure 3-1. Major Lead Exposure Pathways from Mother to Infant**

## CHAPTER 4. DISTRIBUTION OF BLLS, RISK FACTORS FOR AND SOURCES OF LEAD EXPOSURE IN PREGNANT AND LACTATING WOMEN

### KEY POINTS

- ♦ Risk factors for lead exposure in pregnant women differ from those described for young children.
- ♦ Common risk factors for pregnant women include recent immigration status, practicing pica, occupational exposure, use of alternative remedies or cosmetics, use of traditional lead glazed pottery, and nutritional status.
- ♦ Pica during pregnancy appears to occur more frequently in sections of the South and in immigrant communities where this behavior is a culturally acceptable practice.
- ♦ Lead-based paint is less likely to be an important exposure source for pregnant women than it is for children, except during renovation or remodeling of homes built before 1978.
- ♦ Sources of lead exposure in the United States vary by population subgroup and geography; therefore, public health agencies should be consulted for community-specific risk data.
- ♦ Fetal exposure to lead through maternal bone lead mobilization is possible for women with significant prior lead exposure; however, most women with blood lead levels typical in the United States are unlikely to contribute substantial burdens to their infants.

### INTRODUCTION

This chapter discusses the distribution of blood lead levels in women of childbearing age, risk factors relevant to this population, and sources of lead exposure. Information on the distribution of blood lead levels in pregnant women in the United States is derived from cross-sectional surveys, case reports, and epidemiological studies. From the direct, albeit limited, information on the distribution of blood lead levels in pregnant women, along with the available complementary information on blood lead levels in women of childbearing age and in occupational settings, it is evident that the risk factors for lead exposure in pregnant women differ from those described in young children. Health care providers and public health departments need to understand the risk factors specific to pregnant women in order to identify sources of lead in pregnant women, provide patient education and counseling, and intervene to prevent or reduce exposures.

For pregnant women, recent immigration and practicing pica are major risk factors for blood lead levels  $\geq 5$   $\mu\text{g}/\text{dL}$ . Occupational lead exposure and nutritional status are also important risk factors warranting assessment. Certain culturally specific practices, such as the use of alternative remedies or imported cosmetics and the use of traditional lead glazed pottery for cooking and storing food, are important risk factors for lead exposure in pregnant women (Centers for Disease Control and Prevention 2004; Saper et al. 2004, 2008). Some population groups, such as immigrants, are more likely to be at risk for exposure from these sources. Shannon (2003) identified seven severely lead poisoned women who were exposed to sources of lead including ingestion of soil, pottery, or paint chips; household renovations; and use of herbal remedies. Lead-based paint is less likely to be an important exposure source for pregnant women than it is for children, except during renovation or remodeling in homes built before 1978.

Additionally, recent evidence has shown that bone resorption increases during pregnancy in all women (see Chapter 3). Although not an issue for most women with blood lead levels typical in the United States, fetal exposure to lead through maternal bone lead mobilization may be a concern for women with significant lead exposure earlier in life, either in the United States or in their countries of origin.

## **EPIDEMIOLOGY OF BLOOD LEAD LEVELS IN U.S. WOMEN**

### **Distribution of Blood Lead Levels Among U.S. Women of Childbearing Age**

Lee et al. (2005) studied determinants of blood lead in U.S. women of childbearing age using data from NHANES III (1988-1994). The geometric mean blood lead level among women aged 20-49 years ( $N = 4,393$ ) was  $1.78 \mu\text{g/dL}$  (range 0.7-31.1). Approximately 30%, 6%, and <1% of the women had blood lead levels  $\geq 2.5 \mu\text{g/dL}$ ,  $\geq 5 \mu\text{g/dL}$ , and  $\geq 10 \mu\text{g/dL}$ , respectively. A number of factors were associated with higher blood lead levels including higher maternal age, Black or Hispanic race/ethnicity, living in the Northeast region or in urban areas, lower educational level, poverty, lower hematocrit, alcohol use, cigarette smoking, and higher serum protoporphyrin level. Number of live births, breastfeeding history, year house was built, and type of drinking water were not significantly associated with differences in blood lead. Subjects in the first phase of the survey (1988-1991) had significantly higher weighted mean blood lead levels ( $2.0 \mu\text{g/dL}$ ) than those in the second phase 1991-1994 ( $1.6 \mu\text{g/dL}$ ), suggesting a decreasing trend in population average blood lead levels over time ( $p < 0.01$ ).

NHANES data from 1999-2002 showed an even lower geometric mean blood lead level of  $1.2 \mu\text{g/dL}$  among women age 20-59 (Centers for Disease Control and Prevention 2005). Mean blood lead levels were significantly higher in Blacks ( $1.4 \mu\text{g/dL}$ ) and intermediate in Mexican Americans ( $1.3 \mu\text{g/dL}$ ). The percentage of women 15-49 years old with blood lead levels  $\geq 10 \mu\text{g/dL}$  is 0.3% and  $\geq 5 \mu\text{g/dL}$  is 0.9% (Centers for Disease Control and Prevention 2008, unpublished data).

McKelvey et al. (2007) studied blood lead among New York City adults using data from the 2004 New York City Health and Nutrition Examination Survey (NYC HANES). Further analyses performed by the authors (unpublished) specific to women 20-49 years of age ( $N = 755$ ) found that the geometric mean blood lead level was  $1.30 \mu\text{g/dL}$  (range 0.33-27.3). Approximately 10.5%, 1.4%, and 0.2% of the women had blood lead levels  $\geq 2.5 \mu\text{g/dL}$ ,  $\geq 5 \mu\text{g/dL}$ , and  $\geq 10 \mu\text{g/dL}$ , respectively. Blood lead was positively associated with: age; non-Hispanic Black, White, or Asian race/ethnicity, compared to Hispanic; foreign birth; and former and current smoking. Blood lead was inversely proportional to educational level. After multivariable adjustment, Asian race/ethnicity was the strongest predictor of blood lead level. In a separate study focused solely on immigrant mothers who gave birth in New York City in 2003, Graber et al. (2006) found that mean blood lead levels decreased with age by  $0.032 \mu\text{g/dL}$  per year (see Case Study 4-1).

### **Reported Occupational Exposures Among U.S. Women of Childbearing Age**

CDC's state-based Adult Blood Lead Epidemiology and Surveillance (ABLES) program tracks laboratory-reported BLLs in adults (age 16 years and older) from 37 states who have been tested through workplace monitoring programs or on the basis of clinical suspicion of lead exposure above background levels. The lowest reportable BLL varies by state and some states only report elevated results, not all test results. In the 10 states that reported BLLs of any level in 2004, information was reported on 10,527 women of childbearing age (16-44 years). Among these women, 13% (1,370) had BLLs  $\geq 5 \mu\text{g/dL}$ ; 4.5% (476) had BLLs  $\geq 10 \mu\text{g/dL}$ , and fewer than 1% (86) had BLLs  $\geq 25 \mu\text{g/dL}$ . Of the women with BLLs  $\geq 5 \mu\text{g/dL}$ , 32.3% reported occupational exposures; of those employed, the majority were in the manufacturing sector. Because testing practices vary by employer and clinician, reporting practices vary by state, and all lead exposed women may not be tested, these data should not be used to estimate population-based rates of specific blood lead levels in the general population of women (Centers for Disease Control and Prevention 2007).

## RISK FACTORS FOR LEAD EXPOSURE IN U.S. WOMEN OF CHILDBEARING AGE

Recent immigration to the United States and pica behavior are risk factors that have been shown to be associated with lead exposure above background levels in pregnant women, although they are actually behaviors that serve as proxies for other sources of lead. Women with a friend or relative identified with lead exposure above background levels are also more likely to have increased blood lead levels (Handley et al. 2007). In addition, the unique physiology of pregnancy and lactation has been shown to result in increased bone turnover and, thus, higher maternal BLLs. Nutrition may play a role in the extent to which lead is absorbed and the extent of bone turnover. An understanding of these factors is useful in assessing the sources of lead exposures in pregnant women and in developing interventions to prevent and/or interrupt lead exposure. Figure 4-1 presents common risk factors for lead exposure by pregnant women in the United States.

### Recent Immigration to the United States

A number of studies have identified immigrant status as a primary risk factor for lead poisoning in women and young children in the United States (Klitzman et al. 2002; Tehranifar et al. 2008). Immigrant status is a risk factor for blood lead levels much higher than concurrent blood lead levels in U.S. women of childbearing age in at least three ways. First, women from countries where relatively high lead exposure is endemic may carry high cumulative body burdens of lead. (Appendices III and V provide information about lead sources and culturally specific products associated with specific countries or regions.) Brown et al. (2000) investigated determinants of bone and blood lead concentrations in women in Mexico City during the early postpartum period and found that maternal age and time spent living in Mexico City, an area with high ambient lead contamination, were strong predictors of bone lead levels. Second, immigrants may transport lead-containing products, cultural practices, and behaviors with them from their countries of origin. Third, some recent immigrants may live in poor conditions that increase their risk for exposure to lead-based paint and other lead hazards from renovation and repair. In addition, since immigrant women may face cultural, linguistic, economic, and legal barriers to early prenatal care, these risk factors may be compounded by delays in identification and management of lead poisoning.

Data on 75 pregnant women identified with blood lead levels  $\geq 15$   $\mu\text{g}/\text{dL}$  were provided in the Annual Report 2006 for Preventing Lead Poisoning in New York City. Of these 75 women, 99% were foreign born (68% were from Mexico) and 73% reported using imported products during pregnancy, including foods, spices, herbal medicines, pottery, and cosmetics. None of the women were exposed to lead at work.

Klitzman et al. (2002) reported on thirty-three pregnant women in New York City with blood lead levels of 20  $\mu\text{g}/\text{dL}$  or higher identified from 1996-1999 by the New York City Department of Health and Mental Hygiene blood lead surveillance program. Ninety percent of individuals were foreign born, the majority being from Mexico (57%), with a median time in the United States of 6 years (range 1 month to 20 years). Two-thirds of the women had levels between 20 and 29  $\mu\text{g}/\text{dL}$  and possible sources of exposure were identified in 97% of these cases. Overall, thirteen (39%) reported pica behavior; 7 (21%) reported using imported pottery for cooking; and 8 (24%) reported consuming imported spices, tea, and/or food. Other sources identified included vitamins and supplements, lead-based paint hazards, and previous history of exposure to lead.

Graber et al. (2006) conducted a retrospective record review of pregnant women seeking prenatal care from January 2003 to June 2005 at an inner-city women's health center serving a largely immigrant population in Elmhurst Hospital, Queens, New York City. Of the 4,814 women seeking care, 91% were foreign born and 9% were U.S. born. These data from an inner-city medical clinic suggest that prenatal lead exposure disproportionately occurs during the pregnancies of immigrant women from certain countries and occurs at a prevalence high enough to warrant universal blood lead testing (see Case Study 4-1).

Handley et al. (2007) studied 214 women in 2002-2003 who were enrolled in health department clinics in Monterey, California, for their prenatal care. The study population was 95% Latina and 87% were born in Mexico. Sixty-six of the women were born in Oaxaca, Mexico. The prevalence of blood lead levels  $\geq 10$   $\mu\text{g}/\text{dL}$

in the study population was 12%, much higher than concurrent blood lead levels in the U.S. population in general. Women with blood lead levels  $\geq 10$   $\mu\text{g}/\text{dL}$  were more likely to be born in Oaxaca (96%), more likely to eat foods imported from Mexico (84%), and more likely to report having a friend or relative with "lead in their blood" (28%). This study identified home-prepared grasshoppers (chapulines) sent from Oaxaca as a source of lead exposure.

#### Case Study 4-1. Prenatal Lead Exposure in New York City Immigrant Communities: The Elmhurst Queens Experience

Of the 124,345 babies born in New York City in 2003, 52% were to mothers who were born outside of the United States (New York Vital Statistics). Since many of the sources of lead for pregnant women are related to cultural practices, past exposures, and certain occupations, the prevalence of elevated blood lead levels among pregnant women in New York City is likely to be higher than U.S. averages. A retrospective record review of pregnant women seeking prenatal care at an inner-city women's health center was conducted in order to describe the epidemiology of blood lead levels among pregnant women in an inner-city, primarily immigrant population. Computerized registration and laboratory data for pregnant women seeking prenatal care from January 2003 to June 2005 at the Women's Health Center at Elmhurst Hospital, Queens, New York, were reviewed.

#### Distribution of Age and Blood Lead Levels (BLLs) for U.S.- and Foreign-Born Pregnant Women in Elmhurst, Queens, NY (January 2003-June 2005)

	U.S. Born	Foreign Born	All Women
<b>N (%)</b>	446 (9.3)	4,368 (90.7)	4,814
<b>Age (years)</b>	23.7	28.3	27.8
<b>Age Range</b>	14-43	13-52	13-52
<b>Mean BLL (<math>\mu\text{g}/\text{dL}</math>)</b>	1.2	2.4	2.3
<b>BLL Range</b>	0-17	0-31	0-31
<b>% with BLL <math>\geq 10</math> <math>\mu\text{g}/\text{dL}</math></b>	0.2	1.2	1.1
<b>% with BLL <math>\geq 5</math> <math>\mu\text{g}/\text{dL}</math></b>	1.6	11.5	10.6

Note: All difference between the two groups were statistically significant ( $p < 0.001$ )

One hundred countries of origin were represented in the sample. Pregnant women who were born outside of the United States were 8.2 times (95% CI = 3.8 to 17.3) more likely to have a BLL  $\geq 5$   $\mu\text{g}/\text{dL}$ . Those women with the highest mean BLLs and percent with BLLs  $\geq 5$   $\mu\text{g}/\text{dL}$  were from Bangladesh (4.39  $\mu\text{g}/\text{dL}$ , 36.6%), Mexico (3.23  $\mu\text{g}/\text{dL}$ , 20.9%) and Pakistan (2.86  $\mu\text{g}/\text{dL}$ , 17.6%).

Women from countries where leaded gasoline is still in use had higher mean BLLs (3.42  $\mu\text{g}/\text{dL}$ ) and percent of women with BLLs  $\geq 5$   $\mu\text{g}/\text{dL}$  (24.6%) in comparison to women from countries where leaded gasoline is no longer in use (1.42  $\mu\text{g}/\text{dL}$ , 1.9%). Mean BLL decreased with age by 0.032  $\mu\text{g}/\text{dL}$  per year ( $p < 0.001$ ). Mean BLL increased by 0.14  $\mu\text{g}/\text{dL}$  ( $p < 0.05$ ) from 2003 to 2005 as did the percent of women with BLLs  $\geq 10$   $\mu\text{g}/\text{dL}$ . BLLs did not vary by time of year.

From Graber N, Gabinskaya T, Forman J, Gertner M. 2006. Prenatal lead exposure in New York City Immigrant communities [poster]. In: Pediatric Academic Societies (PAS) 2006 Annual Meeting, April 29-May 3, 2006, San Francisco.

## Pica

Although formal pica definitions vary, the behavior common to all definitions of pica is a pattern of deliberate ingestion of nonfood items. Some definitions focus solely on the eating behavior (e.g., Medline defines pica as “a pattern of eating non-food materials (such as dirt or paper)” (Medline Plus 2009). Western medicine has viewed pica as aberrant and unhealthy behavior, an eating disorder, or a psychiatric diagnosis. For example, the American Psychiatric Association defines pica as the “compulsive eating or appetite for nonnutritive substances, either non-food items (e.g., clay, soil) or some food ingredients (e.g., starch, ice), which persists for more than one month” (American Psychiatric Association 1994). However, respected non-Western community institutions have historically accepted pica as a way to improve health. Pica has been practiced by people worldwide for medicinal, religious, and cultural reasons since antiquity (Abrahams and Parsons 1996; Hunter and de Kleine 1984). The Greeks and Romans used clay to treat various medical conditions. Certain Catholic sects in Central America have sold clay tablets inscribed with Christian scenes for centuries. These clay tablets, known as *tierra santa*, which are blessed before sale and believed to have health-giving properties, are available throughout Mexico and Central America. Clay tablets are also produced and sold throughout many parts of Africa and are eaten—generally not for religious or health-related purposes, but for their taste and texture.

While pica appears to be relatively rare in the United States, it is a common practice in many parts of the world, particularly in Africa, Asia, and Central America. Prevalence rates have been reported to be as high as 50% to 74% in parts of Africa (Nchito et al. 2004; Sule and Madugu 2001), and 23% to 44% in Latin America (Lopez et al. 2004). In the United States, pica appears to occur more frequently in sections of the South and in immigrant communities where this behavior is a culturally acceptable practice. Prevalence studies of pica in U.S. subpopulations have found 34% in Mexican-born women living in California (Simpson et al. 2000), and 14% (Smulian et al. 1995) to 38% (Corbett et al. 2003) in low-income rural African-American women.

In some studies, women felt that not giving in to pica cravings could harm their fetus and lead to miscarriage, illness, or an unhappy baby (Simpson et al. 2000). Since pica is viewed negatively by the Western medical community (American Psychiatric Association 1994), individuals who engage in pica may be reluctant to disclose that they consume nonfood items if asked directly about the practice. A review of 13 studies published between 1950 and 1987 (Horner et al. 1991) estimated that the risk for pica increases if pica is practiced by other family members and is increased six-fold if the woman had a prepregnancy history of pica. Other factors that may influence whether women are comfortable disclosing pica use include being able to converse in their native language, being able to discuss the practice in private, and being questioned about the practice in an accepting manner by someone from their own community (Simpson et al. 2000).

Materials ingested as pica can be benign or potentially harmful and include ice, paper, dirt, clay, starch, ashes, and small stones as well as substances contaminated with lead or other toxic substances. Pica behavior has been associated with anemia and other nutritional deficiencies in cross-sectional studies, although pica has not been confirmed to be caused by nutritional deficiencies; pica has been associated rarely with more serious side effects, such as gastrointestinal blockages (Edwards et al. 1994; Geissler et al. 1998). Cases of lead poisoning have also been reported if the substances consumed are contaminated with lead. Most commonly these substances have been reported to be lead-contaminated soil and pottery [see Appendix III for a description of commonly ingested substances with pica].

In a case study of one Hispanic pregnant woman in California, Hamilton et al. (2001) found blood lead levels of 119.4 µg/dL in the woman and 113.6 µg/dL in the cord blood at delivery. The woman practiced a form of pica in which she broke a lead-glazed clay pot from Mexico into small pieces and ate several pieces daily. The researchers found that this practice was apparently not uncommon in Mexican women. Shannon (2003) reviewed seven cases of severely lead-poisoned women (BLLs  $\geq 45$  µg/dL) over a 3-year period and identified an additional eight cases from the medical literature. He found that severe lead poisoning in these mainly Hispanic women occurred most often because of ingestion of lead-contaminated clay, soil, and pottery. Presenting features were mostly subtle, consisting of only malaise and anemia.

## **Mobilization of Endogenous Bone Lead in Pregnancy**

Although, the majority of U.S. women of childbearing age are unlikely to have bone lead stores large enough to result in large elevations in maternal blood lead concentrations, at least one recent case report suggested that bone sources at high levels can lead to an increase in BLL (Riess and Halm 2007). There also is evidence that with closely spaced multiple pregnancies, maternal blood lead levels in subsequent pregnancies are lower and the increases in maternal blood lead occurring during late pregnancy and lactation are lower relative to those in the first pregnancy (Manton et al. 2003; Rothenberg et al. 1994). This observation is consonant with observations from the lead industry in the nineteenth and early twentieth century (Legge 1901; Legge and Goadby 1912; Paul 1860), which held that if a lead-poisoned woman had a child, her symptoms would be assuaged. This limited evidence suggests that the greatest concern about lead exposure may be during the first pregnancy, although this observation is probably meaningful only at very high lead levels.

## **Dietary and Lifestyle Factors**

Nutritional status may make women more susceptible to lead exposures. Adequate dietary intake of certain key nutrients (calcium; iron; zinc; vitamins C, D, and E) is known to decrease lead absorption (Mahaffey 1990). Iron deficiency anemia is associated with elevated blood lead levels and may increase lead absorption and also has an additional independent negative impact on fetal development. Calcium deficiency may increase bone turnover since maternal bone is a major source of calcium for the developing fetus and nursing infant. Chapter 7 provides a fuller discussion of nutritional issues. Both alcohol use and cigarette smoking have also been associated with higher lead levels and should be avoided during pregnancy and lactation.

## **SOURCES OF LEAD EXPOSURE**

While various sources of lead exposure in pregnant women in the United States have been identified, these sources vary according to population subgroup and geography. Thus, assessment and reduction of sources must be specific to the community. The sources discussed below are those that have been identified in previous research and should be used as a guide for clinical and public health interventions. Figure 4-2 summarizes general advice for pregnant women to avoid lead exposure, although additional advice may be warranted due to specific local risk factors.

### **Occupational Sources**

Lead is used in more than 100 industries [see Appendix IV for a list of major lead-using industries]. Occupations in which workers may be directly exposed to lead at significant levels include construction; smelting; auto repair; work on firing ranges; painting; manufacturing of ceramics, electrical components, batteries, wire and cable, plastics, pottery, and stained glass; battery and scrap metal recycling; mining; and all types of ferrous and nonferrous metals production. In addition, women and children may be exposed to lead through the inadvertent carriage of lead dust from the workplace on workers' clothing, shoes, or bodies, also known as take-home exposure. Lead dust carried from work settles on surfaces in the vehicle and home, where it can be ingested or inhaled by young children with normal mouthing behavior and by household members handling workers' clothing (Hipkins et al. 2004). The National Institute for Occupational Safety and Health documented cases of take-home lead exposure in a 1995 Report to Congress in response to the Workers' Family Protection Act (National Institute for Occupational Safety and Health 1995).

While BLLs in occupationally exposed individuals have fallen dramatically since lead industry standards were revised in 1978 (Anderson and Islam 2006), occupational exposures are still a source of lead exposure in women (Centers for Disease Control and Prevention 2007). According to reports from the ABLES Program, a total of 442 (32.3%) of the 1,370 females with BLLs >5 µg/dL had occupational exposures (Centers for Disease Control and Prevention 2007). ABLES data from the New York State Department of Health indicate that 46% (62 of 135) of women of childbearing age with moderate BLLs (10-25 µg/dL) reported occupational exposure as the primary source of lead exposure (Fletcher et al. 1999). Automobile battery manufacturing and lead battery re-

covery industries pose the highest risks although workers in the construction trades can also have significant exposures to lead (Centers for Disease Control and Prevention 2007; Fletcher et al. 1999). Laborers and painters have been found to have higher BLLs than other construction trade groups such as plumbers and electricians (Reynold et al. 1999). Construction work that is associated with higher BLLs includes bridge renovation; residential remodeling; and activities such as welding, cutting, and rivet busting (Reynold et al. 1999).

The Occupational Safety and Health Administration (OSHA) has lead standards for general industry (29 CFR 1910.1025) (Occupational Safety and Health Administration 1984) and construction (29 CFR 1926.62) (Occupational Safety and Health Administration 1993). Currently, under the OSHA standards, a worker must be included in a lead medical surveillance program if he/she is exposed to airborne lead levels of 30  $\mu\text{g}/\text{m}^3$  or higher (8-hour time-weighted average) for more than 30 days per year. Partly to diminish the risk that a lead worker takes lead home on his clothing or body (take-home exposure), the lead standards contain provisions requiring access to showers, work clothes, and changing rooms at the workplace. Some workers potentially exposed to high levels of lead may not receive adequate medical surveillance because their work does not result in air lead levels that trigger the required surveillance. Additionally, certain occupations are exempt from the workplace protections established by OSHA. Exempted workers include some public employees and the self-employed. Self-employed workers might include those in cottage industries such as battery reclamation, automobile/radiator repair, pottery and ceramics, and stained glass. These job categories may not be monitored for lead exposures. In some cases, the home itself may function as a cottage industry workplace, increasing the potential for lead exposure to all family members. Undocumented immigrant workers are a particularly vulnerable group in that their access to lead exposure monitoring and protective measures may be limited.

Occupational exposure to lead also remains a problem in developing countries where industries are less likely to be regulated and little environmental monitoring is done. Studies have documented the impact of cottage industries on lead exposure in international settings, including: backyard battery repair and recycling of batteries (Matte et al. 1989) and radiators (Dykeman et al. 2002) and the production of low-temperature fired lead-glazed ceramics (Fernandez et al. 1997; Hibbert et al. 1999) and tiles (Vahter et al. 1997).

### **Lead-glazed Ceramic Pottery**

Of all the culturally specific practices and products that may put pregnant women at risk for lead exposure, the use of traditional lead-glazed ceramic pottery for cooking and storing food is perhaps the most well-documented in the literature (Hernandez-Avila et al. 1991, 1996; Romieu et al. 1994). Lead-glazed ceramics production is a mostly home-based or cottage industry in Mexico where lead monoxide (PbO; 93% lead by weight) is used to make a glaze that is often set in low-temperature (<1,000 degrees), wood-fired kilns. Pottery produced in this manner can leach large amounts of lead into food and beverages being cooked, served, or stored. This traditional pottery is used throughout the country across all levels of socioeconomic status. Acute high-dose exposures from foods and beverage contaminated by traditional Mexican pottery have been reported (Matte et al. 1994) and long-term use of lead-glazed ceramics may result in chronic low-to-moderate lead poisoning and elevated body burden of lead (Hernandez-Avila et al. 1991). Cases of lead poisoning have been reported after the consumption of crushed lead-glazed pottery, mainly among Hispanic women (Shannon 2003).

### **Herbal and Alternative Remedies**

Lead has been found in some alternative medicines and therapeutic herbs traditionally used by East Indian, Indian, Middle Eastern, West Asian, and Hispanic cultures (Garvey et al. 2001; Saper et al. 2004, 2008). These alternative medicines can contain herbs, minerals, metals, or animal products. Lead and other heavy metals are put into certain folk medicines intentionally because these metals are thought to be useful in treating some ailments. They have also been reported to be added to increase the weight of the product for substances sold by weight. Sometimes lead unintentionally gets into the folk medicine during grinding, coloring, or other methods of preparation. Lead has been found in powders and tablets given for arthritis, infertility, upset stomach, menstrual cramps, colic, and other illnesses. Case Study 4-2 describes lead poisoning associated with ayurvedic medicines.

Most of the published literature relating herbal therapies and alternative medicines to elevated BLLs has been in case reports of children or adults (Ernst 2002; Lynch and Braithwaite 2005), not specifically in women of childbearing age or pregnant or lactating women. Many of the alternative therapies used were self-administered, rather than recommended by a traditional healer or health care provider. In a case study of one 45-year old Korean man who drank Chinese herbal tea for medicinal purposes, Markowitz et al. (1994) found a blood lead level of 76 µg/dL. The lead exposure was found to be hai ge fen (clamshell powder), one of 36 ingredients in the tea, which had become contaminated with lead. In another report, Cheng et al. (1998) described that six of eight children found to be taking herbal medicines had BLLs >10 µg/dL. Use of greta was described in a 2-year-old boy identified with a blood lead level of 83 µg/dL in a CDC report (1993). A review of 1991-1992 California data yielded 40 cases with BLLs >20 µg/dL where children had received ethnic remedies. Over 80% of these children had Hispanic surnames (Centers for Disease Control and Prevention 1993). Tait et al. (2002) reported on a 24 year-old woman from India who immigrated to Australia and delivered a child there with a neonatal BLL that was the highest recorded for a surviving infant in the country (cord BLL was 158.3 µg/dL). An exposure assessment revealed the mother's long-term ingestion of lead-contaminated herbal tablets as the source.

Use of herbal and alternative remedies is not confined to immigrant communities and reported use is substantial among the general population, as documented in several studies. Eisenberg found in a 1990 national U.S. survey that 34% of English-speaking adults >18 years of age reported use of at least one unconventional therapy (Eisenberg et al. 1993). Only 10% reported receiving these alternative therapies from a traditional healer or health care provider and 72% did not tell their medical doctor that they used unconventional therapy. Highest use was in non-Black individuals between the ages of 25 to 49 with relatively higher education and income. A follow-up survey conducted in 1997 found that use had increased to 42% (Eisenberg et al. 1998). More than 60% did not tell their medical doctors that they used alternative therapies. A 2001 New York City study found that 47% of women used medicinal therapies (Factor-Litvak et al. 2001). In a questionnaire survey of herbal medicine use among 734 women who had recently or were about to give birth in Massachusetts, Hepner et al. (2002) found that 7.1% reported the use of herbal remedies mostly on the advice of their health care provider. Although the rates of reported use of herbal and alternative remedies vary, symptomatic cases of lead poisoning have been reported from these sources.

#### **Case Study 4-2. Lead Poisoning Associated with Ayurvedic Medications, California (2003)**

Lead poisoning can occur from use of alternative or folk remedies. Ayurveda is a traditional form of medicine practiced in India and other South Asian countries. Ayurvedic medications can contain herbs, minerals, metals, or animal products and are made in standardized and nonstandardized formulations.

A woman aged 31 years visited an emergency department with nausea, vomiting, and lower abdominal pain 2 weeks after a spontaneous abortion. One week later, she was hospitalized for severe, persistent microcytic anemia with prominent basophilic stippling that was not improving with iron supplementation. A heavy metals screen revealed a BLL of 112  $\mu\text{g}/\text{dL}$ ; a repeat BLL 10 days later was 71  $\mu\text{g}/\text{dL}$ , before initiation of oral chelation therapy. A zinc protoporphyrin measurement performed at that time was  $>400 \mu\text{g}/\text{dL}$ . Her husband's BLL was 6  $\mu\text{g}/\text{dL}$ . No residential or occupational lead sources were identified, but the woman reported taking nine different ayurvedic medications prescribed by a practitioner in India for fertility during a 2-month period, including one pill four times daily. She discontinued the medications after an abnormal fetal ultrasound 1 month before her initial BLL. Analysis of her medications revealed 73,900 ppm lead in the pill taken four times daily and 21, 65, and 285 ppm lead in three other remedies. Her BLL was 22  $\mu\text{g}/\text{dL}$  when she was tested 9.5 months after the initial BLL testing.

From Centers for Disease Control and Prevention. 2004. Lead poisoning associated with ayurvedic medications—five states, 2000-2003. *MMWR Morb Mortal Wkly Rep* 53;582-4.

#### **Imported Cosmetics**

Kohl, also known as 'al kohl' or 'surma', is a gray or black eye cosmetic applied to the conjunctival margins of the eyes that can contain up to 83% lead. It is used in the Middle East, India, Pakistan, and some parts of Africa for medicinal and cosmetic reasons (Parry and Eaton 1991). It is believed to strengthen and protect the eyes against disease. These cosmetics have been associated with elevated lead levels in children (Mojdehi and Gurtner 1996; Sprinkle 1995) and may also be used by women of childbearing age (Moghraby et al. 1989), especially those who are recent immigrants to the United States. [See Appendix V For a detailed list of alternative medicines, herbs, and cosmetics that may contain lead.]

#### **Foods and Other Consumer Products**

Lead can enter the food chain from contaminated soil or water, deposition from the air, or contact with food containers and processing. In the United States, dietary intakes of lead have been reduced due to: the removal of lead from gasoline; the elimination of lead-soldered cans and lead-based printing ink on candy wrappers and bread bags; and changes to agricultural practices, such as banning of lead-arsenate pesticides (Bolger et al. 1991, 1996). The U.S. Food and Drug Administration (FDA) maximum total tolerable daily intake (TTDI) of lead is 6  $\mu\text{g}/\text{day}$  for children under 6 years of age, 25  $\mu\text{g}/\text{day}$  for pregnant women, and 75  $\mu\text{g}/\text{day}$  for other adults (Bolger et al. 1996; Carrington et al. 1996; U.S. Food and Drug Administration 1993). These values were established when dietary intake levels were higher than current estimates. Several scientists have suggested that this standard be revised and made more rigorous, which would lower the TTDI for children to 1  $\mu\text{g}/\text{day}$  (Carrington et al. 1996; Ross, et al. 2000). Nonetheless, results from the Total Diet Study (sometimes called the market basket study)—an ongoing assessment by FDA that determines levels of various contaminants and nutrients in foods—indicate that current levels of lead in the U.S. food supply are quite low (available at <http://www.cfsan.fda.gov/~comm/tds-toc.html>). The estimated daily dietary intake in the United States is currently estimated to be in the range of 2 to 10  $\mu\text{g}$ .

On occasion, imported foods and food products brought to the United States have been identified with elevated levels of lead. For instance, Lozeena is an orange powder used to color rice and meat that contains 7.8%-8.9% lead (U.S. Centers for Disease Control and Prevention 1998). FDA has issued warnings about tamarind candy lollipops (labeled Dulmex brand "Bolorindo") imported from Mexico due to high levels of lead that may be associated with the product, especially in the wrapper (U.S. Food and Drug Administration 1993, 2001). Analysis of these wrappers, which children may chew on or lick, showed between 21,000 to 22,000 parts per million (ppm) of lead while the lollipop sticks contained more than 400 ppm of lead, and the candy itself contained approximately 0.2 ppm of lead. Recently, the FDA revised the recommended maximum lead level for lead in candy to 0.1 ppm (U.S. Food and Drug Administration 2006). Traditional food products that are contaminated with lead may be brought into the U.S. through unregulated routes (Handley et al. 2007). Chapulines (grasshoppers) from Mexico, for example, have been found to contain high levels of lead and have been the subject of a health alert by the California Department of Health Services (California Department of Health Services 2003). "Natural" calcium supplements derived from animal bone may contain lead (Ross et al. 2000; Scelfo and Flegal 2000). Waterfowl may ingest lead shot, become contaminated, and possibly be consumed by unsuspecting hunters and their families (Levesque et al. 2003). In addition, regular ingestion of game meat harvested with lead ammunition may be a source of lead exposure (Kosnett 2009).

### **Lead in Drinking Water**

Control measures taken during the last two decades, including actions taken under the requirements of the 1986 and 1996 amendments to the Safe Drinking Water Act and the Environmental Protection Agency's (EPA) Lead and Copper Rule (U.S. Environmental Protection Agency 1991, 1997a), have greatly reduced exposures to lead in tap water. Even so, lead still can be found in some metal water taps, interior water pipes, or pipes connecting a house to the main water pipe in the street (Centers for Disease Control and Prevention 2004b). Lead found in tap water usually comes from the corrosion of older fixtures or from the solder that connects pipes. When water sits in leaded pipes for several hours, lead can leach into the water supply. Most studies show that consumption of lead-contaminated water alone would not be likely to elevate blood lead levels in most adults to a level that is toxicologically significant, even exposure to water with a lead content close to the EPA action level for lead of 15 parts per billion (ppb) (U.S. Environmental Protection Agency 1991). Risk will vary, however, depending upon the individual, the circumstances, and the amount of water consumed. For example, infants who drink formula prepared with lead-contaminated water may be at higher risk because of the large volume of water they consume relative to their body size and the higher percentage of lead they absorb (Baum and Shannon 1997). [See related discussion on lead in reconstituted infant formula, Chapter 9.] Officials in communities that are considering changes in water additives or that have implemented such changes in water disinfection should assess whether these changes might result in increased lead in residential tap water (Centers for Disease Control and Prevention 2004b; Miranda 2007). EPA has asked all state health and environmental officials to monitor lead in drinking water at schools and day care centers.

### **Lead Paint: Home Repair, Renovation, and Remodeling Activities**

Lead-based paint was commonly used in homes built before 1950, and was not banned from sale for residential use in the United States until 1978. Recent studies estimate that more than 38 million U.S. homes still contain some lead-based paint, with two-thirds of the houses built before 1960 containing lead-based paint hazards (Jacobs et al. 2002). Lead-based paint hazards were concentrated in homes with incomes less than \$30,000 (35% vs. 19% in homes with incomes >\$30,000) and in the Northeast and Midwest where the prevalence was twice as high as in the South and West.

Lead in paint and house dust are the most common sources of exposure in U.S. children (Lanphear et al. 1998). Among adults, however, exposure to lead-based paint and construction-related lead hazards occurs mainly during home repair, renovation, and remodeling activities conducted by the residents themselves or due to improper work practices of tradesmen and contractors (Centers for Disease Control and Prevention 2009;

Feldman 1978; Fischbein et al. 1981; Jacobs 1998; Jacobs et al. 2003; Marino et al. 1990; Reisman et al. 2002; U.S. Department of Housing and Urban Development 1995).

Two basic circumstances increase the risk for an adult's exposure to lead-based paint: if paint has deteriorated, and when paint has been disturbed during remodeling or renovation. Paint deterioration can be caused by moisture problems, poor maintenance, or other problems. The paint on moveable building components (friction and impact surfaces such as windows and doors) pose higher risks because routine opening/closing can damage the paint on their surfaces over time and lead-based paint was used on these components historically. Property owners should take precautions when repainting surfaces with deteriorated paint or performing any remodeling or renovation work that disturbs painted surfaces (such as scraping off paint or tearing out walls) (U.S. Environmental Protection Agency 1997b).

The U.S. government defines lead-based paint hazards as not only encompassing lead-based paint, but also dangerous levels of lead in settled dust and bare soil. Testing for lead-based paint hazards can be done either by obtaining dust wipe samples from the floor and window sills or by using a portable x-ray fluorescence analyzer (XRF) to document the presence of lead in paint. EPA's 2001 hazard standard (40 CFR 745) set the benchmark for floor dust lead level at 40  $\mu\text{g}/\text{ft}^2$  and 250  $\mu\text{g}/\text{ft}^2$  for interior window sills.

### **Lead-contaminated Soil**

Soil may contain lead from deteriorating, exterior lead-based paint or other sources such as deposition from years of leaded gasoline use or industrial emissions. Lead-contaminated soil can be tracked into the home and mixed with household dust, which may also contain lead from interior paint sources. In the United States, lead-contaminated soil is defined as a hazard if there is 400 ppm of lead in bare soil in children's play areas or an average of 1,200 ppm for bare soil in the rest of the yard (U.S. EPA 2001). Poisoning from lead-contaminated soil is most common among young children who play on the floor and commonly mouth objects, but has also been reported to occur in women who consume lead-contaminated soil. For example, cases of lead poisoning have been reported after the consumption of lead-contaminated soil (Case Study 4-3). Exposure to lead from food grown in lead contaminated soil in urban gardens has also been noted (Finster et al. 2004).

### **Case Study 4-3. A Case of Lead Poisoning from Soil Ingestion During Pregnancy**

S.N. is a 33-year-old woman who was pregnant four times with three living children. She was born in Jamaica, West Indies, and immigrated to the United States during her most recent pregnancy. Her obstetric history included three prior uncomplicated full-term vaginal deliveries. She registered for prenatal care at 19 weeks' gestation with no significant historical problems. On questioning, she revealed a history of pica, eating soil from near her house. Her initial tests included a blood lead level of 26 µg/dL, free erythrocyte protoporphyrin 48 (normal < 35 µg/dL), Hgb 9.5 g/dL, and Ferritin 4.9 ng/dL. She was counseled to stop the pica behavior and referred for genetic and nutritional counseling and to a special lead clinic. Her repeat blood lead level at 23 weeks' gestation was 13 µg/dL. Environmental lead tests of the water were negative. Soil tests were negative, except for areas around the garage door of her house. The patient had no knowledge of lead levels or lead testing during her other pregnancies in Jamaica. She was admitted for induction of labor at 38 weeks' gestation due to preeclampsia. She had a normal spontaneous vaginal delivery of a girl, 3,395 grams. Apgar scores were 9 at 1 minute and 9 at 5 minutes. She was discharged on day 3 and followed postpartum as her blood pressure gradually decreased to normal levels. Her postpartum blood lead level was 13 µg/dL and free erythrocyte protoporphyrin 60. S.N. decided to breastfeed and bottle-feed. At 6 weeks, the baby was noted to have a blood lead level of 20 µg/dL.

From: Hackley B, Katz-Jacobson A. 2003. Lead poisoning in pregnancy: a case study with implications for midwives. *J Midwifery Womens Health* 48(1):30-8.

### **Point Sources of Lead**

Point sources of lead exposure include active mining and smelting operations, lead contamination at former mining and smelting sites, and industrial emissions, such as those from battery-manufacturing and recycling activities, particularly in international settings where environmental regulations and monitoring programs may not be in place. Studies have documented the impact of lead mining and smelting activities, both in the United States and elsewhere (Baghurst et al. 1987; Benin et al. 1999; Graziano et al. 1990), and women who live near active or former lead mines and smelters may be exposed to high levels of lead contamination.

### **Leaded Gasoline**

Recognition of the toxic effects of lead has prompted interventions that have resulted in reductions in lead exposure in many countries. In the United States, standards to phase out leaded gasoline use were first implemented in 1973 (U.S. Environmental Protection Agency 1973). In 1995, leaded fuel accounted for only 0.6 % of total gasoline sales in the United States and, in 1996, the Clean Air Act banned the sale of leaded fuel for use in on-road vehicles (U.S. Environmental Protection Agency 1996). A worldwide initiative to phase-out lead in gasoline has already stimulated important reductions in ambient air lead levels and population blood lead levels in some countries (Cortez-Lugo et al. 2003; Romieu et al. 1992). A complete phase-out of leaded gasoline was completed throughout the Latin American and Caribbean region by 2005 (Burke 2004; Walsh 2007). However, in some parts of Africa, Asia, and the Middle East, leaded gasoline is still common (Partnership for Clean Fuels and Vehicles 2007). The impact of leaded fuel is more important in urban settings, given their higher vehicular density.

### **Hobbies and Recreational Activities**

Hobbies and recreational activities that may cause exposure to lead include, but are not limited to creating stained glass; enameling copper; casting bronze; making pottery with certain leaded glazes and paints; casting ammunition, fishing weights, or lead figurines; jewelry making and electronics (with lead solder); glassblowing with leaded glass; print-making; refinishing old furniture; distilling liquor; hunting; and target shooting.

Table 4-1. Risk Factors for Lead Exposure in Pregnant and Lactating Women

- ♦ **Recent immigration from or residency in areas where ambient lead contamination is high.** Women from countries where leaded gasoline is still being used (or was recently phased out) or where industrial emissions are not well controlled.
- ♦ **Living near a point source of lead,** such as lead mines, smelters, or battery recycling plants (even if the establishment is closed).
- ♦ **Working with lead or living with someone who does.** Women who work in or who have family members who work in lead-industry (take-home exposures).
- ♦ **Using lead-glazed ceramic pottery.** Women who cook, store, or serve food in lead-glazed ceramic pottery made in a traditional process and usually imported by individuals outside the normal commercial channels.
- ♦ **Eating nonfood substances (pica).** Women who eat or mouth nonfood items that may be contaminated with lead (such as soil or lead-glazed ceramic pottery).
- ♦ **Using alternative or complementary medicines, herbs, or therapies.** Women who use imported home remedies or certain traditional herbs that may be contaminated with lead.
- ♦ **Using imported cosmetics or certain food products.** Women who use imported cosmetics, such as kohl or surma, or certain imported foods or spices that may be contaminated with lead.
- ♦ **Engaging in certain high-risk hobbies or recreational activities.** Women who engage in high-risk activities or have family members who do.
- ♦ **Renovating or remodeling older homes without lead hazard controls in place.** Women who have been disturbing lead paint and/or creating lead dust or spending time in such a home environment.
- ♦ **Consumption of lead-contaminated drinking water.** Women whose homes have leaded pipes or source lines with lead.
- ♦ **Having a history of previous lead exposure or evidence of elevated body burden of lead.** Women who may have high body burdens of lead from past exposures, particularly those who are deficient in certain key nutrients (calcium, iron).
- ♦ **Living with someone identified with an elevated lead level.** Women who may have exposures in common with a child, close friend, or other relative living in same environment.

**Table 4-2. Key Recommendations to Prevent or Reduce Lead Exposure in Pregnant and Lactating Women**

- Never eat or mouth nonfood items, such as clay, soil, pottery, or paint chips, because they may be contaminated with lead (see Appendix III).
- Avoid jobs or hobbies that may involve lead exposure, and take precautions to avoid take-home lead dust if a household member works with lead. Such work includes construction or home renovation/repair in pre-1978 homes, and lead battery manufacturing or recycling. [See Appendix IV]
- Avoid using imported lead-glazed ceramic pottery produced in cottage industries (described elsewhere in this chapter) and pewter or brass containers or utensils to cook, serve, or store food.
- Avoid using leaded crystal to serve or store beverages.
- Do not use dishes that are chipped or cracked.
- Stay away from repair, repainting, renovation, and remodeling work being done in homes built before 1978 in order to avoid possible exposure to lead-contaminated dust from old lead-based paint. Avoid exposure to deteriorated lead-based paint in older homes.
- Avoid alternative cosmetics, food additives, and medicines imported from overseas that may contain lead, such as azarcon, kohl, kajal, surma, and many others listed in Appendix V.
- Use caution when consuming candies, spices, and other foods that have been brought into the country by travelers from abroad, especially if they appear to be noncommercial products of unknown safety.
- Eat a balanced diet with adequate intakes of iron and calcium, and avoid the use of cigarettes and alcohol.

### Key Recommendations for Initial Blood Lead Testing

- Blood lead testing of all pregnant women in the United States is not recommended.
- State or local public health departments should identify populations at increased risk for lead exposure and provide guidance about community-specific risk factors to assist clinicians in determining the need for blood lead testing for identified populations or for individuals at risk.
- Routine blood lead testing of pregnant women is recommended in clinical settings that serve populations with identified risk factors for lead exposure.
- In clinical settings where routine blood lead testing of pregnant women is not indicated on the basis of community-specific risk factors, health care providers should consider the possibility of lead exposure in individual pregnant women by evaluating risk factors for exposure as part of a comprehensive occupational, environmental, and lifestyle health risk assessment of the pregnant woman [see Table 4-1]. Blood lead testing should be performed if a single risk factor is identified at any point during pregnancy.
- When indicated, blood lead testing should take place at the earliest contact with the patient, ideally pre-conceptionally or at the first prenatal visit, and be conducted using venous blood lead tests only.
- Both maternal and infant blood lead level test results, along with relevant environmental findings, should be incorporated into both the mother's and the infant's medical records in a timely fashion. Even though such records are likely to be maintained separately, these data are necessary for proper medical management of mother and infant.

### Key Recommendations for Follow-up Blood Lead Testing

- A toxicological threshold for adverse health effects has not been identified. Thus, follow-up blood lead testing is recommended for pregnant women with BLL  $\geq 5$   $\mu\text{g/dL}$  and their newborn infants to inform environmental and clinical decision-making.
- Pregnant women with confirmed BLLs  $\geq 45$   $\mu\text{g/dL}$  should be considered as high-risk pregnancies and managed in consultation with experts in lead poisoning and high-risk pregnancy.

## INTRODUCTION

This chapter describes considerations for initial and follow-up blood lead testing during pregnancy and early infancy. It provides information for providers, public health agencies, and communities to guide the approach to the testing and follow up of blood lead levels where lead exposure above background levels is either known or thought to be a concern or where there is no information on the epidemiology of blood lead levels among the target groups (pregnant women and infants less than 6 months of age). The tables outlining frequency of follow-up blood lead testing of newborns [Table 5-1] and infants [Table 5-2] exposed *in utero* fill a gap left by the CDC recommendation for the follow-up testing of lead-exposed children, which begins at age 6 months (Centers for Disease Control and Prevention 1991, 2002).

The strategy described in this chapter for secondary prevention of lead toxicity through testing and identification of lead-exposed pregnant women is focused on the individual. However, a primary prevention strategy of community-focused reduction of lead sources is crucial to prevent the adverse consequences of lead exposure. Secondary prevention strategies, such as testing and follow up of lead exposure above background levels in individual women, do not adequately prevent exposure or the resultant adverse health outcomes. An understanding of the community characteristics, ethnicity, cultural practices, local industry and common occupations, and alternative medicine use practices will assist in identifying groups of women at risk for lead exposure. This strategy may be successful in primary prevention of exposure to the developing fetus and infant if it guides health education and outreach activities in high-risk communities.

## **IDENTIFICATION OF PREGNANT WOMEN WITH ELEVATED BLOOD LEAD LEVELS**

### **Screening for Elevated Blood Lead Levels**

The purpose of screening pregnant women is to identify women exposed to lead who can reasonably be expected to benefit from the knowledge of their lead exposures above background levels and subsequent actions to prevent additional lead exposure or adverse effects to themselves or their fetuses. In this report, screening refers to a laboratory test that is performed on a blood sample from an asymptomatic person to determine if that person has evidence of lead exposure above background levels. One goal of identifying pregnant women at risk is to prevent the potential adverse health outcomes for mother and infant associated with lead exposure during pregnancy. As described in Chapter 2, evidence suggests that no threshold exists for the impacts of lead on maternal health or on the birth, growth, and neurodevelopmental outcomes of the offspring. NHANES data on the blood lead levels of U.S. women of childbearing age indicate that a BLL  $\geq 5$   $\mu\text{g/dL}$  is higher than the 98th percentile (or 3 standard deviations) for this population (Centers for Disease Control and Prevention 2009, unpublished data). Thus, a BLL  $\geq 5$   $\mu\text{g/dL}$  indicates that a pregnant woman has been exposed to lead well above the U.S. average exposure.

The U.S. Preventive Services Task Force (USPSTF) recently completed a review of the evidence for lead screening in pregnancy. USPSTF found no studies examining the effectiveness of screening or interventions on improving health outcomes in asymptomatic pregnant women, and a lack of availability of evidence for interventions to reduce blood lead levels in this population. The potential harms of screening cited include false-positive test results, anxiety, inconvenience, work or school absenteeism, and financial costs associated with repeated testing (Risshitelli et al. 2006; U.S. Preventive Services Task Force 2006). However, the USPSTF review did not assess the health impact on subpopulations exposed to lead prenatally or during breastfeeding or the benefits of screening only such subgroups.

CDC has determined that there is evidence for health effects in asymptomatic pregnant women at the population level and that a threshold for these effects has not been established. However, there is currently a lack of evidence of improved outcomes from interventions provided to pregnant women with a BLL  $\geq 5$   $\mu\text{g/dL}$  since no studies on this point exist. Therefore, the traditional model for medical decision-making of a case definition linked directly to a proven clinical treatment is not useful in this context. Until such research data are available, and given the convincing evidence of neurodevelopmental effects of lead in the prenatal period, CDC recommends a precautionary approach, noting that a BLL  $\geq 5$   $\mu\text{g/dL}$  in a pregnant woman indicates that she has or has recently had exposure to lead well above that for most women of child bearing age in the U.S. population. Since there are still many potential lead sources that a pregnant woman can encounter, a blood lead test is a simple and inexpensive way to identify pregnant women with lead exposures above background levels, so that lead sources can be identified and further exposure can be prevented in the best interests of the mother and child. In addition, source identification and remediation activities may benefit other household and community members, depending upon the source in question, as well as the mother and fetus/infant in subsequent pregnancies. Finally, in contrast to abstract and generalized anticipatory guidance, blood lead test results above background levels are also concrete and actionable data points that may help focus attention by an expectant woman on the challenge of identifying and reducing lead exposure.

## **Blood Lead Testing in the General Population and High-risk Subgroups**

Universal blood lead testing of all pregnant women in the United States is not warranted (Rischitelli et al. 2006; U.S. Preventive Services Task Force 2006) considering the current estimated prevalence of elevated blood lead levels is less than 1% of women of childbearing age (Centers for Disease Control and Prevention 2009, unpublished data). However, routine blood lead testing may be warranted in specific U.S. subpopulations at increased risk for lead exposure due to local, community-specific factors, such as environmental sources of lead or the demographics of the population. In addition, individual characteristics and behaviors put certain populations of women of childbearing age at increased risk for lead exposure relative to that of the general population.

The presence of risk factors in a subpopulation of pregnant women, for example in a particular clinic population, is an indication for routine blood lead testing among all pregnant women in this subpopulation. [See Case Studies 4-1 and 4-2 for examples from Elmhurst, New York, and California, respectively.] State or local public health departments should provide clinicians with information on community-specific risk factors appropriate for use in determining the need for routine blood lead testing, including data describing the distribution of blood lead levels in the community and local knowledge of immigration patterns and ethnicity, common occupations, alternative medicine use, cultural practices, local industries, and idiosyncratic sources. Routine testing should continue in subpopulations known to be at increased risk until the specific risk factors within that population are better understood and more targeted methods for identifying women at increased risk can be employed.

The presence of a large industry in a community, such as a battery recycling plant or a lead smelter, is also indication for blood lead testing of the local pregnant population. A list of occupations with the potential for lead exposure can be found in Appendix IV. When the prevalence of lead exposure above background levels is known to be high in certain communities, it may benefit the providers to develop a centralized blood lead testing program at a local hospital, clinic, or community center.

## **Individual Risk Factor Assessments**

Blood lead testing of individual pregnant women based on individual risk factors may be warranted even when blood lead testing of population subgroups is not warranted. Identification of women who may be at increased risk for lead exposure consists of a comprehensive occupational, environmental, and lifestyle history to assess individual risk. However, validated risk factor questionnaires do not currently exist to predict who would benefit from blood lead testing. Local variation in lead exposure patterns makes national development of such a tool impractical. Instead, development (or adaptation) and validation of a risk factor questionnaire should occur at the local level, under the leadership of local public health authorities, after local risk factors for lead poisoning in pregnancy have been ascertained.

In general, when risk factor questionnaires are used, a positive answer to any question should prompt the measurement of the patient's blood lead level. The New York City Department of Health and Mental Hygiene developed a short tool consisting of five questions (New York City Department of Health and Mental Hygiene 2006) [see Figure 5-1]. The Minnesota Department of Health recommends a seven-question tool (Minnesota Department of Health 2007) [see Figure 5-2]. At the time of publication of this document, these risk factor questionnaires have not yet been validated. Nevertheless, such questionnaires do have an inherent educational value, as they stimulate dialogue between the health-care provider and patient and create an opportunity to educate families about lead hazards.

Assessments of other risk factor questionnaires primarily for children have been conducted, including one that was adapted for use with pregnant women. Stefanak et al. (1996) assessed the accuracy of the CDC childhood lead poisoning risk questionnaire (Centers for Disease Control and Prevention 1991) for administration as a screening tool to 314 pregnant women. In this study, which included both rural and urban areas, questions

associated with elevated blood lead in pregnant women included the following: home built before 1960 with chipping or peeling paint, current smoker, and consumption of more than nine servings of canned food per week. Women who answered “yes” to any one of those questions were five times more likely to have an elevated blood lead level (BLL  $\geq 10 \mu\text{g/dL}$ ) ( $p < 0.001$ ). The authors calculated the sensitivity and negative predictive value of the CDC questionnaire to be 75.7% and 93.1%, respectively, in this population, suggesting a high confidence that a negative response would classify a respondent correctly. However, the positive predictive value was only 46%, suggesting less confidence in a positive response to correctly classify individuals. When a full 19-question survey was administered, the sensitivity and negative predictive value increased to 89.2% and 96.4%, respectively. The performance difference between the questionnaires is most likely because the CDC childhood lead poisoning risk factor questionnaire developed for children does not target the major sources of lead exposure in pregnant women.

### **Clinical Indicators for Blood Lead Testing**

Clinical indications for measuring a blood lead level include the presence of a risk factor for exposure, physical signs or symptoms, or the presence of a household member with known lead exposure above background levels. Most individuals with measurable lead exposure above background levels are asymptomatic. When symptoms or physical findings of lead poisoning are present, they are often difficult to differentiate as they are generally nonspecific and quite common. These include constipation, abdominal pain, anemia, headache, fatigue, myalgias and arthralgias, anorexia, sleep disturbance, difficulty concentrating, and hypertension, among others. Blood lead levels should be measured when these symptoms are present and the suspicion of a source of lead exists. Blood lead levels should also be measured in the work-up of acutely ill pregnant women presenting with severe abdominal colic, seizure, or coma, and considered in the differential diagnosis of consistent constitutional symptoms (e.g., persistent headache, myalgias, fatigue, etc.) and anemia.

### **Timing of Blood Lead Testing During Pregnancy**

Identifying maternal lead exposure prior to conception or early in the pregnancy potentially offers the most benefit to the developing fetus. Unfortunately, lead poisoning is frequently identified late in pregnancy. Klitzman et al. (2002) reports that the median gestational age at diagnosis was 25.4 weeks (range 6 to 39), while Shannon (2003) reports that lead poisoning was discovered in the third trimester in 12 of 15 (86%) subjects after the women presented with subtle but characteristic findings of severe lead poisoning, including malaise, anemia, or basophilic stippling on blood smear. Early blood lead testing may not always identify lead poisoned women sooner in cases where the exposure is first occurring during pregnancy, such as pregnancy-related pica behavior. In these cases, the measurement of a BLL preconception or early in the first trimester may precede the patient's exposure. Earlier testing, however, does have the benefit of early identification in pregnant women with chronic, ongoing, or historical cumulative exposures (Hu 1991; Hu and Hernandez-Avila 2002; Hu et al. 1996). Therefore, it is recommended that blood lead testing of women at increased risk take place at the earliest contact with the patient, ideally preconceptionally or at the first prenatal visit.

### **Methods to Collect Blood Samples for Testing**

Although blood lead levels can be measured from both capillary and venous samples, the preferred method for adults is a venous blood sample in a vacuum tube. Venous samples are more reliable than capillary blood lead levels, which can be inaccurate due to environmental contamination or dilution of the specimen from finger squeezing. Capillary samples can be used if strict protocols are employed to reduce the risk for contamination; however, even if obtained under these conditions, a capillary BLL  $\geq 5 \mu\text{g/dL}$  requires confirmation with a venous blood lead test.

### **Methods to Analyze Lead Levels in Blood**

Blood lead levels from venous samples should be analyzed by a certified laboratory using one of the approved methods such as: inductively coupled plasma mass spectroscopy (ICP-MS), graphite-furnace atomic

absorption spectrophotometry (GFAAS), or anodic-stripping voltammetry (ASV). Specimen tubes for collection should be lead-free and laboratories should be consulted about the preferred specimen tube and collection procedures. For details about laboratory analytic procedures see *Analytical Procedures for the Determination of Lead in Blood and Urine, Approved Guideline* (Parsons et al. 2001); available at <http://www.clsi.org/source/orders/free/c40-a.pdf> 22.

Using a centralized laboratory ensures the accuracy of testing and enables better compliance with local reporting requirements. Clinical Laboratory Improvement Act (CLIA) certification of laboratories and participation in national proficiency testing programs helps assure that the methods employed for blood lead testing are accurate and precise to within a specified range of BLLs. Regardless of the method employed, CLIA-mandated proficiency testing programs require accuracy to within the range of  $\pm 4 \mu\text{g/dL}$  (or  $\pm 10\%$ ). The limits of detection, accuracy, and precision of BLL determination will vary with the type of method used and among laboratories using the same method. Of the three commonly used methods, ICP-MS and GFAAS have limits of detection of about  $0.3\text{--}1.0 \mu\text{g/dL}$  with values reported to two significant figures. ASV has a detection limit of  $1\text{--}3 \mu\text{g/dL}$  and is less precise usually reporting values as whole numbers, but is adequate for BLL testing above the limit of detection. For medical interpretation and decisions on management, BLLs can be rounded to a whole number.

Measurement of the BLL of patients at risk for lead exposure can also be done at the point-of-care using a portable blood lead analyzer (Pineau et al. 2002; Shannon and Rifai 1997). Although this method offers the benefit of an immediate result and intervention, point-of-care measurements for pregnant women should be limited to situations where sending specimens to a centralized, certified laboratory is not feasible due to logistics, lack of refrigeration, or cost limitations. Any blood lead measurement  $\geq 5 \mu\text{g/dL}$  obtained by this method should be confirmed by a certified laboratory with a venous blood lead test (as noted in the point-of-care's instrument use guidance).

### **Interpretation of Blood Lead Test Results**

Analytical variability must be considered when interpreting blood lead results. Changes in successive blood lead measurements on an individual can be considered significant only if the net difference of results exceeds the analytic variance of the method. The degree of analytical variability between laboratories that employ different analytic methods usually exceeds that within a single laboratory. Therefore, a single laboratory using one analytical method should be used to best compare multiple blood lead results from an individual or a population (Centers for Disease Control and Prevention 2005). As a practical matter, ACCLPP therefore recommends that trends in blood lead levels for an individual should not be considered clinically significant until the magnitude of the change is  $\geq 5 \mu\text{g/dL}$  (Binns et al. 2007).

As described above, a BLL  $\geq 5 \mu\text{g/dL}$  indicates that a pregnant woman has been exposed to lead well above the average U.S. exposure. Separate scientific studies indicate that adverse effects at BLLs  $\geq 5 \mu\text{g/dL}$  are likely in pregnant women and likely to increase with increasing blood lead levels. Therefore, additional actions on the part of health care providers and public health are indicated for pregnant women with BLLs  $\geq 5 \mu\text{g/dL}$  and their infants (see Table 6-1).

As described in Chapter 6, occupationally exposed women should be referred to an occupational physician or center treating occupationally exposed adults. Steps to minimize lead exposure should be undertaken if the BLL is  $\geq 5 \mu\text{g/dL}$ , and medical removal from workplace exposure should be undertaken if the BLL is  $\geq 10 \mu\text{g/dL}$ .

### **Transmission of Blood Lead Test Results**

Health care providers have two important responsibilities with respect to sharing laboratory reports of blood lead levels. First, blood lead levels of both mother and child should be transmitted and entered into both the mother's and the infant's medical records in a timely fashion. For instance, the infant's initial and sequential

BLLs should be in the mother's chart, and vice versa, as these data should inform decisions about additional blood lead testing, breastfeeding, and environmental interventions, among other actions. In addition, information about identified lead exposure sources can be clinically useful and should be shared.

In jurisdictions where reporting of BLLs is not done by laboratories, health care providers should also notify the Lead Poisoning Prevention Program of the local or state health department of confirmed BLLs  $\geq 10$   $\mu\text{g}/\text{dL}$  in a pregnant woman to ensure that health department data are complete and that women receive appropriate services from public health. The report should include complete demographic information on the patient, the health care provider's name and phone number, and the method of sample collection (venous or capillary).

### **FOLLOW-UP TESTING IN THE PREGNANT WOMAN**

Once a blood lead level  $\geq 5$   $\mu\text{g}/\text{dL}$  has been identified, an important component in the management of lead-exposed individuals is follow-up blood lead testing to assess trends. After the source of exposure has been identified and removed, it is expected that the BLL will decline. However, there is no clear formula to estimate the expected rate of decline of BLLs in exposed women or their offspring. Several factors play a role, including duration of the exposure, presence of physiological stressors affecting bone turnover rates, nutritional status, and medical and environmental interventions.

Follow-up blood lead testing is indicated for pregnant women with a BLL  $\geq 5$   $\mu\text{g}/\text{dL}$  according to the schedules in Table 5-3. At higher BLLs, a follow-up confirmatory BLL might be indicated earlier than on the schedule provided. Even a single BLL  $\geq 5$   $\mu\text{g}/\text{dL}$  should prompt the asking of certain risk related questions as soon as possible. Depending on the answers, it may be important to take immediate action. For example, if a pregnant woman from India has a BLL of 10  $\mu\text{g}/\text{dL}$  and is taking ayurvedic supplements, she should be advised to immediately stop taking the supplements instead of waiting weeks for another BLL.

When the patient's BLL does not fall after several months, the various factors that may impact the rate of decline (i.e., duration of exposure, psychological stressors, nutritional status, and medical and environmental interventions) should be reconsidered. In some cases, further environmental investigation may be needed. A continuing increase in the measured venous BLL during the follow-up period may indicate continuing or possibly increased exposure to lead and indicates a need for further environmental investigation. Potential causes of rising BLLs in pregnant women include the failure to address the source of the lead or inappropriate management of the lead source; continued use of lead-contaminated products such as spices, foods, cosmetic, folk remedies or lead-glazed ceramics that were not revealed during the initial investigation; and increases in mobilization of bone lead stores from past, high-dose exposures. Additionally, prevention of exposure to lead from occupational sources may not be adequate to maintain a BLL below the level of concern. (See Chapter 6 for medical management guidelines for occupationally exposed women.) Measurement of follow-up BLLs is the main method for determining how urgently additional intervention is needed and whether blood lead levels are declining once interventions, such as removal from the source of exposure, have taken place.

As described in Chapter 3, blood lead levels in pregnancy generally follow a U-shaped curve over the course of pregnancy, with peak blood lead level appearing to be at or near delivery. Assuming unchanging lead intake, the combination of hemodilution, increased weight of organs, and enhanced metabolic activity may account for much of the observed decrease in whole blood lead between 12 and 20 weeks gestation. Accelerated absorption of dietary lead, decreased elimination of lead from the body, and release of bone lead, perhaps following the calcium conservation strategies of late pregnancy, may all operate to yield the observed pattern of lead during pregnancy. Bone resorption dynamics change throughout pregnancy, and the implications for follow-up testing are two-fold. Pregnant women who have an initial blood lead level that is  $\geq 5$   $\mu\text{g}/\text{dL}$  in the first trimester may have a lower BLL on repeat testing during the second trimester, regardless of interventions. This blood lead level may increase prior to delivery and may, in fact, be higher than the initial level. Addition-

ally, the measured BLL of pregnant women in the second and late first trimesters may be an underestimation of the actual body lead burden. However, the magnitude of this change is uncertain and it is unclear whether the change is clinically significant for determining whether a follow-up BLL  $<5 \mu\text{g/dL}$  measured in the first or second trimester should be repeated again at or near delivery. In addition, a single blood lead level cannot be used to establish a woman's risk during her entire pregnancy.

#### **FOLLOW-UP TESTING IN THE NEWBORNS AND INFANTS $<6$ MONTHS OF AGE**

Maternal and umbilical cord lead levels at delivery are, in most cases, highly correlated. However, in a woman with a known BLL  $\geq 5 \mu\text{g/dL}$  during pregnancy, umbilical cord or neonatal lead levels should be measured to establish a baseline for clinical management. Follow-up blood lead testing is indicated for neonates and infants with a BLL  $\geq 5 \mu\text{g/dL}$  according to the schedules in Tables 5-1 and 5-2. After the child is 6 months of age, recommendations from *Managing Elevated Blood Lead Levels Among Young Children: Recommendations from the Advisory Committee on Childhood Lead Poisoning Prevention* (Centers for Disease Control and Prevention 2002) should be followed.

Potential causes of rising BLLs in newborns and infants under the age of 6 months include environmental sources of lead exposure, such as environmental contamination from lead dust and lead in the diet. Not enough is known about the kinetics of lead in the prenatally exposed newborn to make reliable projections about the rate of change of infant BLLs after birth.

#### **FOLLOW-UP TESTING IN THE LACTATING MOTHER AND NURSING INFANT**

Postpartum maternal blood lead levels are expected to increase during the first month after delivery (Osterloh and Kelly 1999; Rothenberg et al. 2000). This increase is thought to be due partially to postpartum hemoconcentration due to fluid loss and is also greater in lactating women than in women who bottle-feed their infants, suggesting that lactation stimulates the release of lead from bone (Tellez-Rojo et al., 2002) and that bone lead mobilization may actually be higher during lactation than in pregnancy (Gulson et al., 1998). These findings illustrate the importance of understanding that an increase in maternal blood lead level after delivery may not necessarily be associated with a new source of exogenous exposure and may, in fact, result from endogenous release of cumulative bone lead stores. However, it is difficult to draw a conclusion from the scientific literature about the magnitude of the change warranting concern. [See Chapter 9 for information on breastfeeding and Table 9-1 for information on follow-up of blood lead levels during lactation.]

**Table 5-1. Follow-up of Initial Blood Lead Testing of the Neonate (<1 Month of Age)**

Initial Venous Blood Lead Level <sup>a</sup> (BLL; µg/dL)	Perform follow-up test(s) <sup>b</sup>
<5	According to local lead screening guidelines for children.
5-24	Within 1 month (at first newborn visit). <sup>c</sup>
25-44	Within 2 weeks. Consultation with a clinician experienced in the management of children with BLLs in this range is strongly advised. <sup>d</sup>
≥45	Within 24 hours and then at frequent intervals depending on clinical interventions and trend in BLLs. Prompt consultation with a clinician experienced in the management of children with BLLs in this range is strongly advised. <sup>d</sup>

<sup>a</sup>The initial blood lead level may be either from an umbilical cord sample at the time of delivery or an infant venous BLL. A venous blood sample is preferred over a capillary sample. Decisions to initiate or stop breastfeeding or initiate chelation therapy should be based on venous blood lead test results only.

<sup>b</sup>If infants are breastfeeding, also follow recommendations in Chapter 9.

<sup>c</sup>According to pediatric health supervision guidelines (well-baby visit schedule) or as clinically indicated based on trends in blood lead levels.

<sup>d</sup>The higher the BLL on the initial test, the more urgent the need for confirmatory testing.

**Table 5-2. Schedule for Follow-up Blood Lead Testing in Infants <6 Months of Age<sup>a,b</sup>**

Venous blood lead level (BLL; µg/dL)	Early follow up (first 2-4 tests after identification or until BLL begins to decline)	Later follow up (after BLL begins to decline)
<10	According to local lead screening guidelines for children	According to local lead screening guidelines for children
10-14	3 months <sup>c</sup>	Within 6-9 months
15-19	1-3 months <sup>c</sup>	Within 3-6 months
20-24	1-3 months <sup>c</sup>	Within 1-3 months
25-44	2 weeks-1 month <sup>c</sup>	Within 1 month
≥45	Within 24 hours <sup>d</sup>	As directed by clinician managing chelation treatment

Adapted from Centers for Disease Control and Prevention. 2002. Managing elevated blood lead levels among young children: recommendations from the Advisory Committee on Childhood Lead Poisoning Prevention. Atlanta: U.S. Department of Health and Human Services.

<sup>a</sup>After 6 months of age, recommendations from Managing Elevated Blood Lead Levels Among Young Children: Recommendations from the Advisory Committee on Childhood Lead Poisoning Prevention (Centers for Disease Control and Prevention 2002) should be followed.

<sup>b</sup>If infants are breastfeeding, also follow recommendations in Chapter 9.

<sup>c</sup>Some case managers or primary care providers may choose to repeat blood lead tests on all new patients within a month to ensure that their BLL levels are not rising more quickly than anticipated. Seasonal variation of BLLs exists and may be more apparent in colder climate areas. Greater exposure in the summer months may necessitate more frequent follow ups.

<sup>d</sup>Consultation with a clinician experienced in the management of children with BLLs in this range is strongly advised.

**Table 5-3. Frequency of Maternal Blood Lead Follow-up Testing During Pregnancy**

<b>Venous<sup>a</sup> Blood Lead Level (BLL; µg/dL)</b>	<b>Perform follow-up test(s)<sup>b</sup></b>
<5	None (no follow-up testing is indicated).
5-14	Within 1 month. Obtain a maternal BLL <sup>c</sup> or cord BLL at delivery.
15-24	Within 1 month and then every 2-3 months. Obtain a maternal BLL <sup>c</sup> or cord BLL at delivery. More-frequent testing may be indicated based on risk factor history.
25-44	Within 1-4 weeks and then every month. Obtain a maternal BLL <sup>c</sup> or cord BLL at delivery.
≥45	Within 24 hours and then at frequent intervals depending on clinical interventions and trend in BLLs. Consultation with a clinician experienced in the management of pregnant women with BLLs in this range is strongly advised. Obtain a maternal BLL or cord BLL at delivery.

<sup>a</sup>Venous blood sample is recommended for maternal blood lead testing.

<sup>b</sup>The higher the BLL on the screening test, the more urgent the need for confirmatory testing.

<sup>c</sup>If possible, obtain a maternal BLL prior to delivery since BLLs tend to rise over the course of pregnancy.

**Figure 5-1. New York City Department of Health and Mental Hygiene: Recommended Lead Risk Assessment Questions for Pregnant Women**

Health-care providers should use a blood lead test to screen pregnant women if they answer "yes" to any of the following questions:

1. Were you born, or have you spent any time, outside of the United States?  
*In NYC, approximately 95% of identified lead-poisoned pregnant women are foreign born. Countries of birth in descending order of frequency include Mexico, India, Bangladesh, Russia, Pakistan, Ecuador, Haiti, Jamaica, Morocco, Dominican Republic, Guatemala, Guyana, El Salvador, Gambia, Ghana, Honduras, Israel, Ivory Coast, Korea, Nepal, Sierra Leone, and Trinidad.*
2. During the past 12 months, did you use any imported health remedies, spices, foods, ceramics, or cosmetics?
3. At any time during your pregnancy, did you eat, chew on, or mouth nonfood items such as clay, crushed pottery, soil, or paint chips?
4. In the last 12 months, has there been any renovation or repair work in your home or apartment building?
5. Have you ever had a job or hobby that involved possible lead exposure, such as home renovation or working with glass, ceramics, or jewelry?

**Figure 5-2. Minnesota Department of Health: Recommended Lead Risk Assessment Questions for Pregnant Women**

Health-care providers should use a blood lead test to screen pregnant women if they answer “yes” or “don’t know” to any of the following questions, or if they have moved to Minnesota from a major metropolitan area or another country within the last 12 months:

1. Do you or others in your household have an occupation that involves lead exposure?
2. Sometimes pregnant women have the urge to eat things that are not food, such as clay, soil, plaster, or paint chips. Do you ever eat any of these things—even accidentally?
3. Do you live in a house built before 1978 with ongoing renovations that generate a lot of dust (for example, sanding and scraping)?
4. To your knowledge, has your home been tested for lead in the water and if so, were you told that the level was high?
5. Do you use any traditional folk remedies or cosmetics that are not sold in a regular drug store or are homemade?
6. Do you or others in your household have any hobbies or activities likely to cause lead exposure?
7. Do you use non-commercially prepared pottery or leaded crystal?

**Key Recommendations for Health Care Providers for the Management of Pregnant and Lactating Women with Blood Lead Levels  $\geq 5$   $\mu\text{g}/\text{dL}$**

For women with prenatal **blood lead levels  $\geq 5$   $\mu\text{g}/\text{dL}$ ,**

- Attempt to determine source(s) of lead exposure and counsel patients on avoiding further exposure, including identification and assessment of pica behavior (see Chapter 4).
- Assess nutritional adequacy and counsel on eating a balanced diet with adequate intakes of iron and calcium (see Chapter 7).
- Perform confirmatory and follow-up blood lead testing according to the recommended schedules (see Chapter 5 [and Chapter 9 if breastfeeding]).
- For occupationally exposed women, review the proper use of personal protective equipment and consider contacting the employer to encourage reducing exposure.
- Encourage breastfeeding consistent with the provisos in Chapter 9.

For women with prenatal **blood lead levels of 10-14  $\mu\text{g}/\text{dL}$ , ALL OF THE ABOVE, PLUS:**

- Notify Lead Poisoning Prevention Program of local health department if BLLs  $\geq 10$   $\mu\text{g}/\text{dL}$  are not reported by laboratory.
- Refer occupationally exposed women to occupational medicine specialists and remove from workplace lead exposure.

For women with prenatal **blood lead levels of 15-44  $\mu\text{g}/\text{dL}$ , ALL OF THE ABOVE, PLUS:**

- Support environmental risk assessment by the corresponding local or state health department with subsequent source reduction and case management.

For women with prenatal **blood lead levels  $\geq 45$   $\mu\text{g}/\text{dL}$ , ALL OF THE ABOVE, PLUS:**

- Treat as high-risk pregnancy and consult with an expert in lead poisoning on chelation and other treatment decisions (see Chapter 8).

*Note:* Women of childbearing age with BLLs  $\geq 5$   $\mu\text{g}/\text{dL}$  who are not currently pregnant or breastfeeding should be followed according to the OSHA medical surveillance guidelines in Appendix C.

## INTRODUCTION

This chapter summarizes actions to be undertaken by health care providers, in coordination with local and state health departments, in providing clinical and environmental services to pregnant and lactating women with BLLs  $\geq 5$   $\mu\text{g}/\text{dL}$ . Both the health department and health care provider have roles to play in keeping pregnant and lactating women and their offspring safe from further lead exposure. The chapter also describes how public health case management can work to coordinate actions between health departments and health care providers to optimize the health of and prevent lead exposure for both the affected mother and fetus or infant.

This report recommends follow-up activities and interventions beginning at BLLs  $\geq 5$   $\mu\text{g}/\text{dL}$  in pregnant women; Table 6-1 presents specific CDC recommendations for medical and public health actions according to blood lead levels of the pregnant/lactating woman receiving intervention. Because the prevalence of BLLs  $\geq 5$   $\mu\text{g}/\text{dL}$ , and especially  $\geq 15$   $\mu\text{g}/\text{dL}$ , is low in the United States, the frequency of follow-up testing recommended herein should not be an undue burden on the health care system. Although the BLL at which particular elements of case management will be initiated is variable by jurisdiction, education and follow-up BLL monitoring should be available for any pregnant woman who has a confirmed BLL  $\geq 5$   $\mu\text{g}/\text{dL}$ . More intense management, including home environmental and source investigation, should be available to any pregnant woman with a BLL  $\geq 15$   $\mu\text{g}/\text{dL}$ .

Unlike the blood lead level of concern of 10  $\mu\text{g}/\text{dL}$  for children, which is a communitywide action level, a BLL of 5  $\mu\text{g}/\text{dL}$  in pregnant women serves a different purpose: it flags the occurrence of prior (or ongoing) lead exposure above background levels, which may not otherwise be recognized. Given the vulnerability of a developing fetus to adverse effects and the possibility of preventing additional exposures, and despite the lack of proven interventions linked to improved outcomes, CDC feels it is prudent to initiate prevention and screening activities for pregnant women showing any evidence of lead exposure above background levels. And, as noted earlier, in contrast to abstract and generalized anticipatory guidance, blood lead test results above background levels are also concrete and actionable data points that may help focus attention by an expectant woman on the challenge of identifying and reducing lead exposure.

This chapter describes the role of clinicians in medical management of pregnant and lactating women with BLLs  $\geq 5$   $\mu\text{g}/\text{dL}$ , including both **clinical interventions**, with reference to detailed chapters, and **environmental counseling to reduce lead exposures**. This chapter also reviews the role of public health agencies in providing **environmental investigations** and **case management**. These essential activities complement those provided by health care providers to ensure that pregnant women receive the full spectrum of appropriate services to identify and reduce exposures to lead.

## **MEDICAL MANAGEMENT: ROLE OF THE HEALTH CARE PROVIDER**

Medical management of pregnant women with BLL  $\geq 5$   $\mu\text{g}/\text{dL}$  consists of two parallel tracks: environmental management and clinical services. The mainstay of management for pregnant women with blood lead levels  $\geq 5$   $\mu\text{g}/\text{dL}$  is removal of the source, disruption of the route of exposure, or avoidance of the lead containing substance or activity. Recommendations for reducing lead exposure are presented below.

**Recommended clinical care** is described throughout this report in the chapters presenting the research base on blood lead testing, nutrition, chelation, breastfeeding, and other issues. For the convenience of readers, a brief overview of important aspects of clinical care to accompany environmental risk reduction is provided in Box 6-1. Each topic presented is discussed in detail in separate chapters, as noted.

Reducing lead exposure can be a complex challenge, which does not always lend itself to straightforward interventions. Lead exposure can occur in the home, community, or workplace, so identifying specific sources of lead and exposure pathway(s) for an individual is essential to reducing exposure for a particular woman. Any or all of the following strategies may need to be applied depending on a woman's residence, lifestyle, or occupation. This section describes the essential actions recommended for health care providers to assess lead exposure and counsel on its reduction.

Source identification beyond obtaining a thorough environmental and occupational history should be conducted in collaboration with the local health department when BLLs are  $\geq 15$   $\mu\text{g}/\text{dL}$ . During this process, local or state health departments will visit the home to conduct in-person interviews and collect samples that allow for more-thorough understanding of the risk factors and lead sources and pathways of exposure. In some jurisdictions, an investigation of the workplace may take place as well. This information should be shared with the health care providers for both the mother and infant. Health care providers can assist in the investigation

by providing information to health departments on suspected sources that are identified during the care of the patient. In identifying the source or risk factors, testing of all family and household members of the patient for blood lead levels will reveal whether the source is common to everyone or unique to the patient.

### **Evaluate Occupational Exposure and Make Appropriate Notifications**

While blood lead levels in occupationally exposed individuals have fallen dramatically since lead industry standards were revised in 1978 (Anderson and Islam 2006), occupational exposures are still a source of lead exposure in women (Centers for Disease Control and Prevention 2007; Fletcher et al. 1999). Public health departments and health care providers should evaluate occupation as a possible source of lead exposure in pregnant or lactating women with BLLs  $\geq 5$   $\mu\text{g}/\text{dL}$  and, if occupational exposure exists, refer these women to an occupational physician or occupational medicine center that treats occupationally exposed adults. Appendix IV lists major lead-using industries.

Under current OSHA standards, workplace protections to reduce lead exposure include medical surveillance, periodic air monitoring, and provision of change and shower facilities to reduce take-home exposure. Medical removal is required by OSHA only when blood lead concentrations exceed 50  $\mu\text{g}/\text{dL}$  (for construction) or 60  $\mu\text{g}/\text{dL}$  (for general industry). BLLs of 40  $\mu\text{g}/\text{dL}$  trigger a medical evaluation. However, the OSHA standards are out of date and are inadequate for protecting the health of lead-exposed workers, especially pregnant women and their offspring. Adverse health effects have been associated with much lower blood lead levels currently set as benchmarks for OSHA enforcement.

New evidence has emerged over the last 20 years showing that both cumulative as well as acute lead exposures pose significant health risks (Kosnett et al. 2007). As discussed in Chapter 2 of this document, lead exposure during pregnancy has been associated with an increased risk for spontaneous abortion and adverse effects on fetal growth and neurodevelopment. In response to current research findings, recent recommendations by Kosnett et al. (2007) and by the Association of Occupational and Environmental Clinics (2007) call for setting the general lead industry blood lead level of concern to 10  $\mu\text{g}/\text{dL}$ ; for occupationally exposed women who are or may become pregnant, the goal is to maintain a BLL  $< 5$   $\mu\text{g}/\text{dL}$ .

From a clinical perspective, it is important to note that the OSHA Medical Surveillance Guidelines included as Appendix C to the 1977 Lead Standard ([www.osha.gov/pls/oshaweb/owadisp.show\\_document?p\\_table=STANDARDS&p\\_id=10033](http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=STANDARDS&p_id=10033)) explicitly states:

“Recommendations [regarding medical removal protection] may be more stringent than the specific provisions of the standard. The examining physician, therefore, is given broad flexibility to tailor special protective procedures to the needs of individual employees. This flexibility extends to the evaluation and management of pregnant workers and male and female workers who are planning to raise children. Based on the history, physical examination, and laboratory studies, the physician might recommend special protective measures or medical removal for an employee who is pregnant or who is planning to conceive a child when, in the physician's judgment, continued exposure to lead at the current job would pose a significant risk.”

The appendix goes on to state: “The adverse effects of lead on reproduction are being actively researched and OSHA encourages the physician to remain abreast of recent developments in the area to best advise pregnant workers or workers planning to conceive children.”

Since substantial research developments have occurred since the 1970s when the OSHA standards were developed, occupationally exposed women who are or may become pregnant should be removed from lead exposure if their blood lead level is  $\geq 10$   $\mu\text{g}/\text{dL}$ . If the blood lead level is in the range of 5 to 9  $\mu\text{g}/\text{dL}$ , the health care provider should ask about potential sources of lead exposure on the job and review appropriate use of personal protective equipment in an effort to reduce exposure. Workplace hygiene should be emphasized in

order to keep exposure as low as possible and to prevent take-home exposures for other household members. Specifically, patients should be advised to

- Wear a respirator and keep it clean.
- Use wet cleaning methods and HEPA vacuums to clean work areas. Never dry sweep or use compressed air.
- Wash hands and face before eating and drinking. Never eat or drink in the work area.
- Normal handwashing and cleaning of eating surfaces may not remove all surface lead, 'lead visualization' wipes are available can help determine if lead has been removed to an adequate degree.
- When possible, wash or shower and change clothes and shoes before leaving work. Keep all work items away from family areas in the home, and wash and dry work clothes separately from other laundry.

Where feasible, the occupational medicine provider should consider contacting the woman's employer with recommended best practices to monitor and reduce lead exposure in their workplace. An example of such a letter is provided in Appendix XIV. Appendix XV contains the California Department of Public Health Workplace Hazard Alert. Prior to issuing such a letter, the healthcare provider should discuss the contents with the affected employee, and obtain her authorization. Although the letter in Appendix XIV refers to the medical removal protection provisions of the OSHA lead standards, the provider and the employee should be aware that some patients (e.g., employees of government agencies, mines, railroads and airlines) may work for a business that does not necessarily fall under OSHA jurisdiction. For these employees, the reference to the OSHA standard should be omitted and the employee should give explicit consent for release of medical information to her employer.

### **Identify and Discourage Pica Behavior**

As discussed in Chapter 4, the behavior common to all definitions of pica is a pattern of deliberate ingestion of nonfood items, which can cause lead exposure if the substances consumed are contaminated with lead. All pregnant women, but especially those with blood lead levels  $\geq 5$   $\mu\text{g}/\text{dL}$ , should be counseled to never eat nonfood items that may contain lead, such as clay, soil, pottery, or paint chips. Appendix III lists commonly reported pica substances.

Once pica is identified, the specific behavior must be characterized in order to determine how best to intervene. Clinicians are encouraged to follow a standardized history outline to obtain a more complete picture of pica behavior for an individual woman. Table 6-2 provides suggested factors to assess and characterize pica behavior, including such issues as the reason(s) for the behavior (if known) and the substance(s) being consumed. Only a few studies are available that evaluate the effectiveness of interventions designed to reduce or eliminate pica behavior. Most of these studies evaluated the impact of interventions on pica behavior in developmentally delayed individuals or those with obsessive-compulsive disorders (Goh et al., 1999; McAdam, et al. 2004; Piazza et al. 1998). Other studies have attempted to reduce pica behavior by providing vitamin supplements and improving the quality of the diet. While this approach appears to be effective in some case reports (Bugle and Rubin 1993; Pace and Toyer 2000), a randomized, double blind, placebo-controlled, two-by-two factorial study found that micronutrient supplementation did not affect geophagy (eating earth) in 220 school-aged children in Zambia (Nchito et al. 2004). They concluded that the results supported the premise that geophagy is a learned activity and that nutritional deficiencies associated with geophagy are more likely to be a result, not a cause, of this practice. No intervention studies were found that included pregnant women.

Therefore, until further research is available that can guide clinical practice, interventions should promote alternative, healthier strategies in response to the patient's apparent reasons for pica. The approach depends

upon eliciting accurate information from the patient about the behavior. In the clinical setting, it may be useful to ask women specifically about the discomforts of pregnancy and the techniques being used to minimize them. Pica has been commonly reported to be used in pregnancy to help relieve abdominal pain, diarrhea, and nausea; to assuage cravings and to improve appetite; and to impart a sense of well-being. Obstetrical providers also should inquire about cravings. Ice pica is particularly common and is often accompanied by pica associated with less benign substances. Inquiring first about general cravings in pregnancy, then about specific cravings for ice, and finally cravings for other less-commonly ingested nonfood items may be more likely to uncover pica behavior. Follow-up questions inquiring about the ingestion of other substances commonly used by members of a woman's community may also help elicit a history of pica.

If the substance is consumed due to cravings, then substitution with a similar, but uncontaminated, substance could be suggested. If a woman is experiencing stomach upset, nausea, or lack of appetite, more appropriate interventions should be followed. Current recommendations of the American College of Obstetricians and Gynecologists (ACOG) for the effective management of nausea and vomiting in pregnancy include vitamin B6 supplementation, use of antiemetic medications, and nonpharmacological approaches such as use of "sea-bands" which use pressure points on the wrist to suppress nausea. These interventions can reduce the discomfort associated with nausea and vomiting of pregnancy by 70% (American College of Obstetricians and Gynecologists 2004). When associated with a psychiatric disorder, appropriate referrals for counseling and behavior modification are warranted.

Descriptive studies have found associations between nutritional deficiencies and pica. Several studies reported lower serum ferritin levels (Edwards et al. 1994; Geissler et al. 1998), lower hemoglobin or hematocrit levels (Corbett et al. 2003; Edwards et al. 1994; Geissler et al. 1998; Rainville 1998), or higher rates of anemia (Ketaneh et al. 2005) in those who engage in pica, while others have found no health effects associated with pica (Smulian et al. 1995). Therefore, women who engage in pica behavior, regardless of the substance consumed, require nutritional counseling.

### **Counsel Women About Avoiding Sources of Lead Exposure**

#### ***Avoid alternative products that may contain lead and stay informed of new risks***

As discussed in Chapter 4, certain products have been found to be contaminated with lead. Some products have been associated clearly with lead poisoning cases and women should be counseled to avoid these products. These include alternative cosmetics, food additives, and medicines imported from overseas that may contain lead, such as azarcon, kohl, kajal, surma, and many others listed in Appendix V. Pregnant women should be informed that herbal medicines and alternative remedies imported personally or ordered from other countries by mail or online are not subject to FDA premarket approval and therefore their safety cannot be assured, even if the product is professionally packaged and labeled. Pregnant women should be cautioned against consuming candies, spices, and other foods that have been brought into the country from travelers abroad, especially if they appear to be noncommercial products, since their safety is unknown.

Obstetrical providers should advise pregnant women not to expose their fetuses to the risks of herbal medicines and supplements (Marcus and Snodgrass 2005). Herbal medicines and supplements are often regarded as safe by the public and some health care providers, but there is no scientific basis for that belief. In addition, certain herbal medicines and supplements are known to be contaminated with lead and, therefore, should be avoided. There are no rigorous scientific studies of the safety of herbal medicines and supplements during pregnancy, and the Teratology Society has stated that it should not be assumed that they are safe for the embryo or fetus (Friedman 2000).

The literature also contains numerous reports of excessive lead intake associated with the use of lead-glazed ceramic pottery produced by artisans or small manufacturers overseas. As noted earlier, pregnant women should be warned that lead leaches out of these products if they are used for food preparation or storage, es-

pecially if used to store acidic liquids such as wine or juice. Leaded crystal glassware is another potential lead source, but one that has not been linked with lead poisoning cases.

On occasion, products available through domestic channels of commerce are found to cause lead exposures to consumers. Recent exposures of concern reported by the media have included jewelry, toys, and other products. In some cases, federal agencies have authority to issue recalls of contaminated products, but sometimes they can only issue warnings. For instance, dietary supplements sold in the United States are not subject to FDA premarket approval, but FDA has authority to act if products are adulterated (e.g., lead contaminated) or misbranded. In either instance, consumer education is essential to avoiding these exposures. Consumers and health care providers can monitor FDA and CPSC recalls and CDC alerts in order to be apprised of newly recognized products of concern. Local health departments can also communicate this information to communities and medical providers. Pregnant women should be given an updated list of products found to be contaminated with lead at their prenatal visits. [For more information, see Chapter 4 and American Academy of Pediatrics (2005); Binns et al. (2007); Centers for Disease Control and Prevention (2002)]. The Consumer Product Safety Improvement Act (CPSIA), which took effect in February 2009, lowered the allowable lead content of consumer products intended for children 12 and younger, setting the standard at 600 ppm of lead in any accessible part. Beginning in August 2009, the allowable concentration declined to 300 ppm, and in August 2011 it will decline to 100 ppm. Starting in 2010, manufacturers must test their products and certify that they meet CPSIA standards. In the meantime, products exceeding the new standard remain prohibited and are subject to recall.

#### ***Avoid using lead-contaminated drinking water***

Lead found in drinking water is usually due to corrosion that causes lead to leach out of plumbing pipes. The Safe Drinking Water Act (1991) prohibited the sale of lead-containing pipe for residential use (U.S. Environmental Protection Agency 1991). Homes built before 1986 are more likely to have lead in pipes, fittings, solder, fixtures, or faucets. Therefore, owners of older homes may want to test their water for lead. Certain attributes of the water, such as its temperature and pH, as well as the presence of additives, can all affect lead levels. Families with private wells as a water source will need to test their water to determine if lead contamination is a problem, as this is not regulated by EPA.

The EPA's community action level for lead in tap water is 15 ppb. If test results exceed this level, public water systems must comply with public education requirements, as well as conduct additional testing. Such public water systems may also be required to conduct source water treatment and/or lead service line replacement. Reducing lead levels in water may also require replacing internal plumbing such as pipes or fixtures or both. Until the source(s) of lead is removed, homeowners should employ several strategies to minimize their exposure to lead in tap water. Flushing the system for several minutes after nonuse discards water that has been standing in the system and is more likely to contain lead. All tap water used for consumption—whether for drinking, cooking, or particularly for preparation of infant formula—should be flushed before use. Use of bottled or filtered water are other alternatives, although not all filtration systems remove lead and not all bottled water is guaranteed to be lead-free. For detailed instructions for flushing water, along with testing information and federal regulations, see the EPA Lead in Drinking Water Web page (<http://www.epa.gov/safewater/lead/index.html>).

#### ***Avoid exposure to lead hazards in housing (paint, dust, soil)***

As noted in Chapter 4, lead-based paint hazards are a major source of exposure for young children. In contrast, the research literature suggests that pregnant women are more likely to be exposed to lead-based paint hazards associated with renovations in older homes. Nevertheless, pregnant women should be educated about the potential risks associated with lead-based paint in older housing for several important reasons. First, pregnant women should understand the importance of using lead-safe work practices in older homes during repair, renovation, repainting, or remodeling work. Failing to minimize and contain dust generated by any ac-

tivity that disturbs paint can increase or create exposure risk. Dangerous paint removal and repair techniques that generate lead dust or fumes such as dry scraping, sanding, burning of paint with a torch, or using a high-temperature heat gun should be avoided—and may be illegal in some jurisdictions or in federally subsidized housing. Without appropriate education, there is a risk that families (or renovation workers) will inadvertently create or worsen lead-based paint hazards as they work diligently to prepare the baby's room or make other home improvements, thereby exposing the pregnant woman and fetus to lead during the pregnancy or afterward when the baby comes home.

Federal law requires that property owners disclose known lead-based paint and lead hazards to prospective buyers and renters of older homes and that remodeling contractors give lead information to residents before renovating homes built before 1978. A new EPA regulation (promulgated April 2008; effective April 2010) requires lead-safe work practices during renovation/repainting projects, and includes strict controls on disturbance of lead paint by a contractor performing renovation in a residence where a pregnant woman resides (see <http://www.epa.gov/lead/pubs/renovation.htm>). Pregnant women and their families should be encouraged to inquire whether painters or other contractors scheduled to perform work in their homes have received training in lead-safe work practices.

Families should also understand the importance of maintaining painted surfaces in older homes. While intact lead-based paint poses little risk, peeling paint or other signs of paint deterioration in a pre-1978 home can result in lead exposure hazards. If there is peeling paint (or any other indication of a problem) in the home of a family that is expecting or has young children, and lead-based paint is suspected to be present, the homeowner or tenant should contact the local health department for advice on options such as testing and remediation.

Appropriate remediation strategies vary according to the location and condition of the lead-based paint and the extent of the contamination. Interventions can include a range of activities such as professional cleaning; thorough repair or replacement of components (e.g., entire windows, window sashes, trim/molding, or door jambs), paint stabilization, complete repainting, or complete paint removal. All of these interventions have been found to significantly reduce lead dust levels for at least 3 years postintervention, with the more intensive treatments found to be associated with greater post-intervention reductions (Dixon et al. 2005). In cases where heavy soil contamination has occurred, the soil may need to be removed. However, when less contamination is present, techniques such as planting with ground covers or installing gravel pathways, drip line boxes, or raised planting beds and play areas may be sufficient (Binns et al. 2004; Dixon et al. 2006).

After interventions have been completed in the home, the home should not be reoccupied until it has passed lead dust clearance testing, indicating that the home has been adequately cleaned and that invisible lead dust has not been left behind. Numerous resources are available for the general public. For more information, see Chapter 11, Resources and Referral Information.

### ***Minimize lead exposure from point sources***

Women who live close to active lead mines, smelters, or battery recycling plants should take precautions to avoid exposure to lead via inhalation exposures or ingestion of hazardous waste (e.g., mine tailings, acid mine drainage) through contamination of the home environment from industrial lead dust or fumes.

### ***Avoid hobbies and recreational activities that may involve lead exposure***

Numerous recreational activities can result in exposure to lead. These activities include crafts (print making, stained glass, ceramics), outdoor sports (hunting and fishing), and liquor distillation, among others. [See Appendix IV for a detailed list.] Since women may not know that these activities carry a risk for lead exposure, consumer education is critical. General safety procedures such as performing these activities in well-ventilated spaces, frequent hand washing, and the use of jacketed ammunition at shooting ranges, can all minimize the risk of lead exposures from recreational activities. Under some circumstances, consumption of game meat

(e.g., venison, wild fowl) harvested with lead ammunition may pose a risk for excess lead exposure (Kosnett 2009). Health care facilities providing care to pregnant women should provide informational brochures to pregnant women on the risks associated with these activities.

## **ENVIRONMENTAL AND CASE MANAGEMENT: ROLE OF PUBLIC HEALTH AGENCIES**

This section describes the essential role of public health agencies in assuring appropriate services for pregnant women needing intervention for lead exposure above background levels. Such public health services are recommended at various blood lead levels to complement ongoing medical management being provided by the woman's health care provider (see Table 6-1). Specifically, public health agencies ensure that lead hazards in the home environment are assessed and remediated. Public health agencies also provide case management services to ensure that all appropriate services are provided. Public health agencies can also provide guidance about reimbursement issues regarding environmental investigation or case management and make referrals to private providers, such as lead risk assessors, if necessary.

### **Environmental Investigation and Management**

As previously noted, the critical element in the prevention of lead exposure is the control or elimination of all sources of lead, which must include the home environment to be effective. The goal of environmental management is to ensure a lead-safe home for mothers and babies. To this end, it is recommended that an investigation of the home environment, which is variously called an environmental investigation, exposure assessment, or risk assessment, be conducted for all women and newborn infants with BLLs of  $\geq 15 \mu\text{g/dL}$  in order to identify potential sources of lead and pathways of exposure and to identify appropriate activities to reduce or prevent further lead exposure. This investigation and subsequent control activities should be carried out by the local or state health department, or under its supervision, as part of case management activities for pregnant and lactating women identified with blood lead levels  $\geq 15 \mu\text{g/dL}$ .

The investigation should include questions about potential lead exposure pathways, a visual inspection of the home and other relevant environments, and testing of specific media for the presence of lead (such as water, household dust, soil, paint chips, foods, ethnic remedies, spices, ceramic ware, or other suspected sources of lead), as indicated. Examples of environmental management protocols for pregnant women are found in Appendix VIII (New York City Department of Health [NYC DOH] Pregnancy Risk Assessment Form), which is used for all women with prenatal BLLs of  $\geq 15 \mu\text{g/dL}$ ; Appendix IX (Minnesota DOH Assessment Interview Form); and Appendix X (Minnesota DOH Lead-Based Paint Risk Assessment Form), which is used for both pregnant women and for children with elevated blood lead levels). An example of an environmental management protocol for infants of mothers with elevated prenatal blood lead levels who do not have elevated BLLs is found in Appendix XI (NYC DOH Primary Prevention Information Form). An example of a protocol for environmental risk assessment for case management of young infants and children with blood lead levels of  $15 \mu\text{g/dL}$  or higher is provided in Appendix XII (NYC DOH Child Risk Assessment Form).

At a minimum, environmental management should include isolating the expectant mother from known exposure sources, by workplace removal for occupational exposures and through temporary relocation until hazard remediation has been completed and clearance achieved for lead-based paint hazards in the home. Local and state health departments may also utilize information and resources provided by the Centers for Disease Control and Prevention's National Center for Environmental Health (NCEH) and other agencies and organizations [see Chapter 11 for resources and referral information] to provide the most current and updated case management services to their constituents (Centers for Disease Control and Prevention 2002).

### **Case Management**

This section is intended to facilitate the management of pregnant and lactating women and newborn infants with lead exposure above background levels by providing information and guidance to health department personnel who provide or oversee care coordination and follow-up activities.

Case management of pregnant women with lead exposure involves coordinating, providing, and overseeing the services required to reduce their BLLs to prevent harm to the developing fetus. It is based on the efforts of an organized team that includes the pregnant woman and newborn infant's health care providers. A hallmark of effective case management is ongoing communication with the health care and other service providers and a cooperative approach to solving any problems that may arise during efforts to decrease the mother-infant pair's BLLs and eliminate lead hazards in the their environment.

CDC recommends that public health agencies provide case management services for pregnant women with blood lead levels  $\geq 15$   $\mu\text{g}/\text{dL}$  (See Table 6-1). These services are adapted from the current model of case management adopted by CDC for young children, which has eight components: a) client identification and outreach, b) individual assessment and diagnosis, c) service planning and resource identification, d) the linking of clients to needed services, e) service implementation and coordination, f) the monitoring of service delivery, g) advocacy, and h) evaluation (Centers for Disease Control and Prevention 2002). Typical case management activities could include the following, depending upon the patient's needs and local resources:

- Assess factors that may impact the woman's BLL (including sources of lead, nutritional status, access to services, family interaction, and understanding).
- Visit the woman's residence and other sites where the woman spends significant amounts of time, such as a job site, to conduct a visual investigation of the site and identify sources of environmental lead exposure. Such visits may be made by a case manager and/or by certified environmental investigators or risk assessors.
- Develop a written plan for intervention.
- Oversee the activities of the case management team.
- Coordinate implementation of the plan, including collaboration with the primary health care provider(s) and other specialists.
- Evaluate compliance with the plan and the success of the plan.
- Ensure that a woman receives services in a timely fashion consistent with guidance.

Another variable, the duration of management, will depend on when the blood lead level  $\geq 5$   $\mu\text{g}/\text{dL}$  is identified—during the prenatal period, at birth, or while the mother-infant pair is nursing. The interventions recommended in this report are for the secondary prevention of adverse health effects from lead exposure; that is, to prevent further lead exposure and to reduce BLLs in pregnant women who have been identified as having lead exposure. However, the ultimate goal is primary prevention of any lead exposure of the developing fetus or newborn infant. Of course, primary prevention is also indicated for women of reproductive age who may become pregnant, not only those who are already pregnant. The importance of primary prevention should not be overlooked, since the behavioral and cognitive effects of lead exposure in young children may be irreversible.

Practices and resources for case management of lead exposure vary markedly among states, cities, and jurisdictions. (In some communities, case management is called care coordination.) The sources of exposure and prevalence of blood lead levels above background levels among pregnant and lactating women and newborn infants also vary by geographic location and community-specific risk factors and may not be readily identifiable. Therefore, users of these guidelines may need to modify them to meet the needs unique to their specific communities. CDC provides technical assistance for the development and implementation of case management protocols.

**Box 6-1: Medical Management of Pregnant Women With BLL  $\geq 5$   $\mu\text{g/dL}$** 

This box provides clinicians with a concise reference on general considerations in medical management of their patients with confirmed lead exposure above background levels. Readers are encouraged to refer to the relevant chapters for additional information.

**Counseling patients on identifying and avoiding lead sources (Chapter 4)**

For all patients, but especially those with known lead exposures, health care providers should provide guidance regarding sources of lead and help identify potential sources of lead in patients' environments. Public health agencies may have additional information on community-specific risk factors based on geographic location, occupation, or ethnic background. If not completed prior to determination of initial blood lead level, providers should take a complete occupational and environmental history, including questions that may identify the presence of risk factors for lead exposure.

**Identification and counseling regarding pica behavior (Chapters 4 and 6)**

Many studies agree that pica behavior is likely to be underreported. Identifying pica in a clinical setting may best be accomplished by treating it as a sensitive issue: proceeding from general to more-specific questions and from less-intrusive to more-intrusive questions. A recommended approach is to ask women specifically about techniques being used to minimize the discomforts of pregnancy and about cravings, inquiring first about general cravings in pregnancy, then about specific cravings for ice, and finally cravings for other less commonly ingested nonfood items. Follow-up questions inquiring about the ingestion of other substances commonly used by members of a woman's community may also help elicit a history of pica. If a substance is consumed due to cravings, then substitution with a similar, but uncontaminated, substance could be suggested. When associated with a psychiatric disorder, appropriate referrals for counseling and behavior modification are warranted. Women who engage in pica behavior, regardless of the substance consumed, may benefit from nutritional counseling due to the documented associations between nutritional deficiencies and pica.

**Nutritional assessment and referrals (Chapter 7)**

Pregnant and lactating women with a current or past BLL  $\geq 5$   $\mu\text{g/dL}$  should be assessed for the adequacy of their diet and provided with prenatal vitamins and nutritional advice emphasizing calcium and iron intake. A balanced diet with a dietary calcium intake of 2,000 milligrams daily should be maintained, either through diet or by supplementation or by a combination of both. Additionally, iron status should be evaluated and supplementation provided in order to correct and prevent any iron deficiency. Women with anemia (defined in pregnancy as a hemoglobin level  $< 11$  g/dL in the first trimester and third trimester and  $< 10.5$  g/dL in the second trimester), requires higher dosing (Institute of Medicine 1990). Generally, pregnant women with iron deficiency anemia should be prescribed 60 to 120 mg of iron daily in divided doses. Dosage can be reduced to 30 mg daily once anemia is corrected. Women receiving supplemental iron or calcium should be encouraged to split the dose, taking no more than 500 mg of calcium or 60 mg of iron at one time, as only small amounts of these nutrients can be absorbed at any one time. Obstetrical providers should advise pregnant women not to expose their fetuses to the risks of herbal medicines, since there is no evidence of their safety and some are known to be lead-contaminated.

### **Interpretation and follow-up of blood lead tests (Chapter 5)**

Pregnant women identified with blood lead levels  $\geq 5$   $\mu\text{g}/\text{dL}$  should be tested per Table 5-3. Follow-up blood lead testing should be performed according to schedules provided in Table 5-1 for newborns and Table 5-2 for infants under 6 months of age. Adjust the frequency of follow-up tests according to the chronicity of exposure; risk factors for continued, repeat, or future exposure; and types of clinical interventions. Occupationally exposed women should be referred to an occupational physician or center treating occupationally exposed adults and removed from the workplace lead exposure at BLL  $\geq 10$   $\mu\text{g}/\text{dL}$ . If not reported directly by the clinical laboratory, the health care provider should notify the Lead Poisoning Prevention Program of the local or state health department of BLLs  $\geq 10$   $\mu\text{g}/\text{dL}$ . Communication with the local or state health department and the pediatric health care provider is crucial in ensuring appropriate follow-up care and developmental monitoring and referrals. Pregnant women identified with blood lead levels  $\geq 5$   $\mu\text{g}/\text{dL}$  should be tested at the time of birth to establish a baseline to guide postnatal care for mother and child, and followed up according to the testing schedule in Table 9-1. If past exposure to lead was higher than for most people, maternal blood lead levels may increase slightly during lactation due to the liberation of lead from bone stores.

### **Assisting with identification of lead sources in the environment (Chapters 4 and 6)**

The essential activity in management of pregnant women with blood lead levels  $\geq 5$   $\mu\text{g}/\text{dL}$  is removal of the lead source, disruption of the route of exposure, or avoidance of the lead-containing substance or activity. Source identification beyond obtaining a thorough environmental and occupational history should be conducted in collaboration with the local health department when BLLs  $\geq 15$   $\mu\text{g}/\text{dL}$ , which will conduct an environmental investigation of the home environment in most jurisdictions. This process usually includes in-home interviews and collection of environmental samples to confirm lead sources and pathways of exposure. Health care providers can assist by providing information to health departments on suspected sources identified during patient care. Findings should be shared with the health care providers of the mother and infant.

### **Chelation therapy (Chapter 8)**

In consultation with a lead poisoning expert, pregnant women with confirmed BLLs  $\geq 45$   $\mu\text{g}/\text{dL}$  may be considered for chelation therapy and should be considered as high risk pregnancies. Immediate removal from the lead source is still the first priority. In some cases, women may need hospitalization. Reserving the use of chelating agents for later in pregnancy is consistent with the general concern about the use of unusual drugs during the period of organogenesis (National Research Council, 2000). However, BLLs  $\geq 70$   $\mu\text{g}/\text{dL}$  may result in significant maternal toxicity and chelation therapy should be considered, regardless of trimester, in consultation with experts in lead poisoning and high-risk pregnancies. Chelation therapy should also be considered in neonates and infants less than 6 months of age for a confirmed BLL  $\geq 45$   $\mu\text{g}/\text{dL}$ .

### **Counseling on breastfeeding (Chapter 9)**

Initiation of breastfeeding should be encouraged for mothers with BLLs  $< 40$   $\mu\text{g}/\text{dL}$ . At maternal blood lead levels between 20-39  $\mu\text{g}/\text{dL}$ , breastfeeding should be initiated accompanied by sequential infant BLLs to monitor trends. A woman with a confirmed BLL  $\geq 40$   $\mu\text{g}/\text{dL}$  should not initiate breastfeeding. She should be advised to pump and discard her breast milk until her blood lead has declined to  $< 40$   $\mu\text{g}/\text{dL}$ . Breastfeeding should continue for all infants with BLLs  $< 5$   $\mu\text{g}/\text{dL}$  or trending downward. For breastfed infants whose blood lead levels are rising or failing to decline by 5  $\mu\text{g}/\text{dL}$  or more, environmental and other sources of lead exposure should be evaluated. If no external source is identified, and maternal BLLs  $> 20$   $\mu\text{g}/\text{dL}$  and infant BLLs  $\geq 5$   $\mu\text{g}/\text{dL}$ , then breast milk should be suspected as the source, and temporary interruption of breastfeeding until maternal blood lead levels decline should be considered.

**Table 6-1. Recommended Actions by Blood Lead Level in Pregnancy**

BLL	Health Care Providers	Public Health Providers
<5	<ul style="list-style-type: none"> <li>▪ Provide anticipatory guidance routinely and health education materials to all pregnant and lactating women</li> </ul>	<ul style="list-style-type: none"> <li>▪ Collect all blood lead test results</li> <li>▪ Develop and disseminate guidelines and health education materials to providers</li> <li>▪ Provide community-specific risk factors and population-based blood lead testing guidance to clinicians</li> </ul>

<sup>a</sup>Environmental interventions to control lead exposures at blood lead levels below those in this chart support the goal of lead-safe housing for all children and are appropriate in jurisdictions with resources available to provide such services.

<sup>b</sup>Blood lead levels ≥70 µg/dL may result in significant maternal toxicity; therefore, chelation should be considered regardless of trimester of pregnancy and in consultation with an identified lead poisoning expert (see Chapter 8 for more details).

**Table 6-2. Suggested Factors to Assess and Characterize Pica Behavior**

Topic	Reason Why Information Is Important	Specific Questions to Ask
<b>Demographics</b>	Context, identify populations at risk	Age, race, ethnicity, country, and region of origin
<b>Substance(s) consumed</b>	Determine if substance(s) are harmful and if extent of use likely to pose health risks, identify source of pica substance(s) for public health interventions if needed	<p>What substance(s) consumed?</p> <p>Dose consumed (amount and frequency)?</p> <p>Substance consumed throughout pregnancy?</p> <p>Where obtained?</p> <p>(Be as specific as possible in case a sample needs to be obtained for testing for contamination)</p>
<b>Reason for use</b>	Useful in being able to elicit a pica history in women of similar background or experiencing similar symptoms, helpful in developing an appropriate plan to help individual woman stop the intake of harmful substances	Reason(s) for use: treatment for specific symptom, general health, or spiritual or emotional well-being
<b>Pica behavior</b>	Understanding of the persistence of the behavior and a clue to how difficult it will be to eradicate	<p>Age at onset?</p> <p>Use affected by hormonal changes (menses, pregnancy, lactation) or stress?</p> <p>Substitution if usual pica substance not available?</p> <p>Is it truly "pica" behavior or a manifestation of an obsessive-compulsive disorder?</p>
<b>Pregnancy history</b>	Improve the understanding of how pica behavior affects pregnancy outcomes	<p>Current pregnancy: gestational age at delivery, birth weight of child, preeclampsia, gestational diabetes</p> <p>Previous pregnancy history: spontaneous abortions, preterm births, low birth weight or macrosomia</p>
<b>Community context</b>	Information will be useful in identifying communities at risk and in planning public health interventions if needed	<p>Current community?</p> <p>Who else consumes substance in community (family, neighbors)?</p> <p>What quality(ies) about the substance is/are important?</p> <p>What problems are thought to be associated with its use?</p>

### Key Points for Nutrition and Lead

- The human body's nutritional status affects the absorption, deposition, and excretion of lead and may also affect lead toxicity.
- Lead exposure can also modify the body's ability to utilize nutrients.
- Avoidance of lead exposure remains the primary preventive strategy for reducing adverse health effects. However, the existence of nutrient-lead interactions suggests that optimizing nutritional status during pregnancy and lactation may assist in preventing the adverse consequences of lead exposure.

### General Nutritional Recommendations for Pregnant and Lactating Women

- All pregnant and lactating women should eat a balanced diet in order to maintain adequate amounts of vitamins, nutrients, and minerals.
- All pregnant and lactating women should be evaluated for iron status and be provided with supplementation in order to correct iron deficiency.
- All pregnant and lactating women should be evaluated for the adequacy of their diets and be provided with appropriate nutritional advice and prenatal vitamins.
- Women in need of assistance should be referred to programs, such as WIC or the Supplemental Nutrition Assistance Program (SNAP) (formerly food stamps).
- All pregnant and lactating women should avoid the use of alcohol, cigarettes, herbal medicines, and any other substance that may adversely affect the developing fetus or infant.

### Recommendations for Pregnant and Lactating Women with Blood Lead Levels $\geq 5$ $\mu\text{g/dL}$

- In pregnant and lactating women with BLLs  $\geq 5$   $\mu\text{g/dL}$  or with a history of lead exposure, a dietary calcium intake of 2,000 milligrams daily should be maintained, either through diet or in combination with supplementation.

## OVERVIEW OF THE RELATION BETWEEN NUTRITION AND LEAD

Pregnancy and the first 2 years of life are exceptionally important intervals with respect to adequate maternal and child nutrition (Horton 2008). Pregnancy and lactation are also critically important periods from a toxicological perspective because of the special significance of the potential for adverse effects of toxic exposures on early human development. If inadequate nutritional status increases susceptibility to the toxic effects of lead, lifelong adverse effects are more likely. In addition, lead exposure can interfere with the metabolism of nutrients—an especially important consideration when nutritional status is marginal. This chapter provides an overview of the information on dietary intake and lead levels in pregnant women. These data are limited. Any beneficial effects of dietary supplementation must be demonstrated in well-designed (randomized, placebo-controlled) clinical trials. However, given the importance of basic nutrition in normal pregnancy and lactation, this chapter provides practical recommendations based on the limited suggestive data available for primary and secondary prevention of lead exposure. Recommended dietary intakes (dietary reference intakes [DRIs]—formerly called RDAs) are from the Institute of Medicine, Food and Nutrition Board, unless specifically noted otherwise, and are provided for reference as Appendix XIII (Institute of Medicine 1997, 2001).

Decades of laboratory and clinical investigation have confirmed that the body's nutritional condition affects lead absorption, deposition, metabolism, and excretion (for reviews see Ahamed and Siddiqui 2007; Bogden et al. 2001; Mahaffey 1980, 1985; Mahaffey et al. 1992; Ros and Mwanri 2003). The physiological mechanisms that are the basis for nutrition/lead interactions are multiple and include nutrients: binding lead in the gut, competing with lead for absorption, altering intestinal cell avidity for lead, or altering affinity of target tissues for lead (Ballew and Bowman 2001). Lead can modify the metabolism of nutrients (Pounds, 1991; Sauk and Somerman 1991). For example, changes in iron metabolism and changes in the formation of the metabolically active forms of vitamin D occur with lead exposure. As understanding of cellular biology has advanced, the mechanisms through which nutritional status (at least for the divalent cations, calcium and iron) alter the metabolic response to lead are becoming clarified (Godwin 2001).

Avoidance of lead exposure remains the primary preventive strategy for reducing adverse effects of lead exposure. However, the existence of nutrient-lead interactions suggests that optimizing nutritional status during pregnancy and lactation may reduce the adverse consequences once lead exposure has occurred. Although the lead-nutrient interaction data are limited and somewhat inconsistent, ensuring adequate intakes of minerals such as calcium; iron; selenium; and zinc, and vitamins C, D, and E is a strategy that is generally health promoting, is associated with few risks, and may confer additional benefits to lead-exposed pregnant and lactating women.

Whether there are benefits for lead poisoned pregnant and lactating women resulting from ingestion of dietary supplements in excess of nutritional requirements is not clear and super-supplementation is not recommended. Differences in response between marginally adequate and super-nutritional status may be physiological. For example, the physiological mechanisms that foster adaptation to low dietary intakes (e.g., increased production of binding proteins in the gastrointestinal tract that can transport lead, as well as calcium or iron) may differ significantly from those that occur when nutrient intakes are higher than required. Dietary supplementation with nutrients at levels higher than those required by nonexposed women may constitute a secondary prevention effort aimed at reducing circulating levels of lead in the mother and at reducing lead exposure to the developing fetus and nursing infant.

Studies of the effects of nutrition and blood lead levels are complicated by a number of different factors. A general problem is that variability in the nutritional status of subjects can impact whether there is a response to changes in the nutrient level. For example, iron absorption is increased when the body is deficient in iron, but when the body is iron-replete absorption of additional iron is inhibited (Finch 1994). These same mechanisms also influence the percent of lead that is absorbed. Specific problems related to observational studies are discussed below.

#### **OBSERVATIONAL STUDIES OF ASSOCIATIONS BETWEEN BLOOD LEAD AND MATERNAL DIET**

The majority of the research on the influence of nutrition on lead status during pregnancy and lactation has been observational. Such studies can only determine the associations between nutritional status and lead poisoning, not whether these associations are causal. Observational studies are further complicated because the intercorrelations between nutrients in the diet limit the identification of the effects of specific dietary components. Observational studies on the association of maternal diet and lead have shown varying results.

In an observational study of maternal diet during pregnancy, higher intakes of calcium, iron, and vitamin D were associated with lower neonatal blood lead levels (Schell et al. 2003). Before treatment, more than 50% of the mothers had dietary intakes below the recommended dietary allowances for zinc, calcium, iron, vitamin D, and kilocalories. Maternal and neonatal blood lead levels were correlated and all of the neonatal blood lead levels were low (geometric mean = 1.58 µg/dL).

West (1994) investigated the relationship between prenatal vitamin supplement use and maternal blood lead levels and pregnancy outcomes in 349 African American women. Supplement users had significantly

lower blood lead levels than those who did not use supplements ( $p = 0.0001$ ). This study did not describe the content of the supplements consumed or provide adherence data, but levels of calcium and vitamins C and E were confirmed by blood analysis and were higher among the reported supplement-users, suggesting that the self-reports were accurate.

Among postpartum women in Mexico City, lower levels of bone lead were associated with higher intakes of calcium, vitamin D, phosphorus, magnesium iron, zinc, and vitamin C, though these relationships showed inconsistent trends (Ettinger et al. 2004). Gulson et al. (2006) measured daily intakes of the micronutrients calcium, magnesium, sodium, potassium, barium, strontium, phosphorus, zinc, iron, and copper from 6-day duplicate diets (2-13 collections per individual) and blood lead concentrations in a small number of mother-child pairs (total of 21 pregnant and 15 nonpregnant subjects in one cohort, nine pregnant subjects in a second cohort, and one group of ten 6- to 11-year-old-children) to evaluate the association of dietary intakes of selected micronutrients and blood lead. They found no statistically significant relationship between blood lead concentration and intake of specific micronutrients (Gulson et al. 2006).

## **ROLE OF SPECIFIC NUTRIENTS WITH RESPECT TO LEAD**

### **Calcium**

#### ***Association of dietary calcium intake and lead***

Increased lead absorption and tissue retention among overtly calcium-deficient experimental animals have been confirmed in multiple species. As shown in experimental animal studies reported in the 1970s, a diet clearly deficient in only calcium when fed to rats for several months produced much higher tissue stores of lead than occurred in animals fed comparable amounts of lead plus a calcium-adequate diet (Mahaffey et al. 1973; Mahaffey-Six and Goyer 1972). Unusually high deposition of lead in nonosseous tissues (including the kidneys) occurred in contrast with less dramatic elevations of bone lead (Mahaffey et al. 1973). This difference likely reflects impaired bone formation and deposition of lead into bones of the high-lead, low-calcium animals (Mahaffey et al. 1973). The increased absorption and retention of lead by calcium-deficient animals has been confirmed in other species (among others, see information for dogs (Hamir et al. 1982; Stowe and Vandeveld 1979) and horses (Willoughby et al. 1972). Generally, the major calcium effects on lead absorption and distribution occur when dietary calcium is deficient (Hertz-Picciotto et al. 2000). Little influence of calcium on lead metabolism is observed by increasing calcium intake above required levels in animal studies, i.e., the equivalent of super supplementation (e.g., Barton et al. 1978; Mahaffey et al. 1973).

Confirmation of the impact of low dietary calcium intakes has also been found among human subjects who were also shown to have increased lead absorption when their diets were low in calcium (Heard and Chamberlain 1982). Several cross-sectional studies of calcium intake and blood lead levels in women of childbearing age and pregnant women have shown an inverse relationship between calcium-rich foods or calcium intake and blood lead levels. Lacasana-Navarro et al (1996) observed a statistically significant association among women of reproductive age between increased calcium intake and reduced risk of blood lead levels  $>10 \mu\text{g/dL}$ . Farias et al. (1996) showed that consumption of foods providing calcium (corn tortillas and milk products) was associated with reduced blood lead levels. Researchers also observed a statistically significant trend among women of reproductive age between decreased risk of elevated blood lead levels ( $>10 \mu\text{g/dL}$ ) with increasing calcium intake (Lacasana-Navarro et al. 1996). Higher milk intake during pregnancy has also been associated with lower maternal and umbilical cord lead levels in postpartum women in Mexico (Hernandez-Avila et al. 1997).

#### ***Dietary calcium supplementation and lead levels***

During pregnancy and lactation, lead accumulated in the maternal skeleton is released (Gulson et al. 1999; Manton et al. 2003; Osterloh and Kelly 1999), with greater mobilization of lead during lactation than during pregnancy (Gulson et al. 1998). Calcium supplements have been suggested as a means of reducing mobiliza-

tion of skeletal mineral. Observations of the variability in release of skeletal lead reinforced the suggestion that low calcium intake may contribute to mobilization of skeletal lead during pregnancy (Gulson et al. 1999). Use of calcium supplements to meet fetal demand for calcium and thereby reduce maternal bone mobilization has been described. Results from Gulson et al. (2004) indicated that calcium supplements were ineffective in minimizing the mobilization of lead from the skeleton during lactation; however, this small observational study lacked a control group and was not designed to properly account for other potential confounding factors.

Calcium supplementation (1,200 mg at bedtime) during the third trimester of pregnancy has been shown, in a randomized crossover trial design, to reduce maternal bone resorption by 14% on average in comparison to placebo (Janakiraman et al. 2003), suggesting that calcium supplements may reduce maternal bone lead mobilization during the third trimester of pregnancy.

Two large randomized clinical trials have been conducted to assess whether calcium supplements reduce blood lead levels during pregnancy and lactation. In a randomized, double-blind, placebo-control trial of calcium supplementation during lactation, Hernandez-Avila et al. (2003) showed that 1,200-mg daily dietary supplementation with calcium carbonate among lactating women reduced maternal BLLs 15%-20% over the course of lactation. Compared with women who received the placebo, those who took supplements had a modest decrease in their blood lead levels of -0.12 µg/dL at 3 months (95% CI = -0.71 to 0.46 µg/dL) and -0.22 µg/dL at 6 months (95% CI = -0.77 to 0.34 µg/dL). The effect was more apparent among women who were most compliant with supplement use and had patella bone lead >5 µg/g bone (-1.16 µg/dL; 95% CI = -0.23 to -2.08). During the second and third trimesters of pregnancy, calcium supplementation (1,200 mg) was associated with an average reduction of 19% in blood lead concentration in relation to placebo ( $p < 0.001$ ) (Ettinger et al. 2009). In another randomized control trial, calcium supplementation (1,200 mg) was associated with modest reductions in blood lead when administered during pregnancy. These effects were strongest in the most-compliant women, including those who: consumed >75% pills (-24%,  $p < 0.001$ ); or had baseline blood lead greater than 5 µg/dL (-17%,  $p < 0.01$ ); or reported use of lead-glazed ceramics and high bone lead (-31%,  $p < 0.01$ ). In the subset of most-compliant women with high patella bone lead (>5 µg/g) and reported use of lead-glazed ceramics, the reduction in blood lead of 31% corresponds to an average reduction of 1.95 µg/dL (95% CI = -0.78 to -2.87). Bone resorption was also reduced by 13% in the supplement group compared with the placebo group ( $p = 0.002$ ) (Tellez-Rojo et al. 2006). Calcium supplementation was also associated with 5%-10% lower breast milk lead levels among these women over the course of lactation (Ettinger et al. 2006), suggesting that calcium supplementation may also be an intervention strategy to reduce lead in breast milk from both current and previously accumulated sources. Such data support the role of calcium supplementation in decreasing bone resorption, which can release bone lead stores. Calcium supplementation may also decrease intestinal absorption of lead.

Overall, calcium supplementation has been associated with modest reductions in blood lead levels both when administered during pregnancy and lactation. Suppression of bone resorption appears to be the most likely mechanism, although reduced absorption of lead from the gastrointestinal tract may also contribute to this change. It has been suggested that high levels of calcium are needed to supply the nutritional needs of the developing fetus (Johnson 2001).

### ***Calcium status in U.S. women***

Calcium requirements during pregnancy and lactation have been investigated extensively. The increased fetal/infant demand for calcium is met by increasing maternal gastrointestinal absorption, decreasing renal excretion, and increasing bone mineral mobilization (Kovacs and Kronenberg 1997). Physiological adaptations (including endocrine responses) are part of why there is no simple relationship between dietary calcium intake and calcium availability to mother, fetus, or infant (Prentice 2000a). In general, however, Americans do not meet dietary recommendations for calcium (Ma et al. 2007), with ethnic minorities and socially disadvantaged groups more likely not meeting dietary calcium recommendations (Affenito et al. 2007). The recommended

intakes for calcium are 1,300 mg for pregnant and lactating women 18 years and younger and 1,000 mg for pregnant and lactating women 19 years of age and older.

Estimated calcium intake during pregnancy in the United States varies substantially. Based on data from 1999-2000 NHANES, average calcium consumption for women of childbearing age was between 820 and 940 grams from both diet and supplements. Earlier data from NHANES II showed that for white women in the 18-through-39 year age group mean calcium intake from food was 642 mg/day, contrasted with 467 mg/day among black, non-Hispanic women (Looker et al. 1993). African Americans in all age groups have been shown to consume fewer mean servings of total dairy, milk, cheese, and yogurt than non-African-Americans and have lower calcium intakes (Fulgoni et al. 2007; Weinberg et al. 2004). Meeting dietary recommendations for calcium on a dairy-free diet is difficult (Gao et al. 2006), but can be made easier through the use of calcium-fortified foods such as citrus juices (Gao et al. 2006) and consumption of ready-to-eat cereals, which facilitate milk intake (Song et al. 2006). In contrast to several of the studies cited above, the assessment by Harville et al. (2004) evaluated total oral calcium intake including both food and antacids. Although median oral calcium intake exceeded 1,200 mg/day, more than 10% of the youngest women consumed <600 mg calcium/day. Within the overall group, 10% of African-American women and 6% of white women reported being either lactose intolerant or allergic to milk. However, there was no difference in calcium intake (both approximately 1,200 mg/day) for women reporting lactose intolerance and not being intolerant. It should be noted that in this particular study, many of the women were enrolled in the Women, Infants, and Children (WIC) program which supplies milk and cheese. In this study racial differences in calcium intake were not significant.

Calcium requirements are increased substantially during pregnancy and lactation to meet the demands of the developing fetus and nursing infant (Prentice 2000b). Approximately 25 to 30 grams of calcium are transferred to the fetus during pregnancy, with the majority of this transfer occurring during the third trimester (Institute of Medicine 1990). The major physiological adaptation of the mother to meet this increased calcium requirement is increased efficiency in intestinal absorption of calcium. Decreased renal excretion of calcium and increased bone mineral mobilization are other maternal mechanisms used to meet the needs of the fetus. The Institute of Medicine (IOM) currently recommends 1,000 mg calcium per day for pregnant and lactating women 19-50 years (and 1,300 mg per day for pregnant and lactating women <19 years) (Institute of Medicine 1997). Optimal calcium intake may be achieved through diet, calcium-fortified foods, calcium supplements, or various combinations of these.

NIH has articulated several challenges to optimize calcium intake (National Institutes of Health 1994). High oxalate and phytate in a limited number of foods can reduce the availability of calcium in these foods. Other factors, such as drugs (glucocorticoids), can decrease calcium absorption. There are also genetic factors that may significantly influence many aspects of calcium metabolism. Vitamin D metabolites enhance calcium absorption. Sources of vitamin D, besides supplements, include sunlight, vitamin D-fortified liquid dairy products, cod liver oil, and fatty fish. Calcium and vitamin D need not be taken together to be effective. Excessive doses of vitamin D may introduce risks such as hypercalciuria and hypercalcemia and should be avoided. In addition, high levels of calcium intake have several potential adverse effects but there are adaptive mechanisms that protect from calcium intoxication at calcium intakes less than approximately 4 g/day. Even at intake levels less than 4 g/day, people may be more susceptible to developing hypercalcemia or hypercalciuria and high blood calcium levels may produce renal damage. There is also some concern that increased calcium intake might interfere with absorption of other nutrients, such as iron, or medications. Ingestion of some forms of calcium supplements or milk may reduce iron absorption by as much as 50%. However, calcium formulations that contain citrate and ascorbic acid enhance iron absorption.

There are two randomized placebo-controlled trials that aimed to decrease lead exposure to fetus and nursing infant by providing 1,200 milligrams of daily calcium supplementation to maternal diet during pregnancy (Etinger et al. 2008) and lactation (Hernandez-Avila et al. 2003). Both studies found that, on average, women in the calcium supplement group had 20% lower maternal blood lead levels than the placebo group at the end

of follow up, suggesting decreased potential for exposure to the fetus and nursing infant. These studies were carried out in Mexico City, Mexico where the estimated average dietary calcium intake was about 800 milligrams per day, similar to estimates in the United States. NHANES data on dietary intake of selected minerals in 1999-2000 indicate that for women aged 20-39, the average dietary intake of calcium is 797 mg (Ervin et al. 2004). In pregnant women with exposure to lead, high calcium intake (2,000 mg/day) may diminish pregnancy-induced increases in blood lead levels by decreasing intestinal absorption of lead or by decreasing maternal bone resorption (mobilization), thereby reducing exposures to the fetus (Johnson 2001). Thus, the amount of calcium supplement should be adjusted by combining estimated average dietary intake and supplementation in order to achieve the recommended calcium intake of 2,000 mg per day. Care should be taken as some calcium supplements, particularly those derived from natural sources (bonemeal, dolomite, or oyster shell), have been found to contain high levels of lead (Bourgoin et al. 1993; Ross et al. 2000; Scelfo and Flegal 2000).

### **Summary**

In summary, calcium supplementation in pregnant women with elevated blood lead levels may be beneficial in reducing blood lead levels. For pregnant and lactating women with BLLs  $\geq 5$   $\mu\text{g}/\text{dL}$  or a history of lead exposure above background levels, a dietary calcium intake of 2,000 mg daily should be maintained either through diet or in combination with supplements.

### **Iron**

#### ***Association of dietary iron intake and iron status with lead levels***

Both low iron status and elevated lead exposure impair hematopoiesis and intellectual development during gestation and infancy (Black et al. 2008). Exposure to lead and reduced iron status result in greater impairment than the lead-associated impairment in heme biosynthesis alone (Kwong et al. 2004; Mahaffey-Six and Goyer 1973). Such findings were confirmed in humans, as well as experimental animals (Barton et al., 1978; Mahaffey 1983).

Iron absorption is highly regulated physiologically and iron absorption is reduced when iron stores are enlarged (Finch 1994). Overall, variation of iron stores in a normal range do not increase lead absorption, but iron deficiency raises the level of divalent metal transporter proteins which carry lead as well as iron (Morgan and Oates 2002). The ability to control iron absorption through regulation of the molecular mechanisms of iron absorption appears during late infancy (Leong et al. 2003).

Iron deficiency is associated with increases in absorption and deposition of lead (Barton et al. 1978). Several cross-sectional studies in children showed an inverse relationship between iron status and blood lead (Bradman et al. 2003; Choi and Kim 2003; Hammad et al. 1996). Consistent with pediatric studies, cross-sectional studies of lead-exposed adults have found that lower serum iron and dietary intake, as well as increased rates of iron deficiency anemia, were associated with higher blood lead levels and better iron status was associated with lower blood lead levels (Baghurst et al. 1987; Graziano et al. 1990; Kim et al. 2003). These studies have generally used dietary intake or laboratory tests (e.g., serum iron or ferritin) to determine iron status.

There are few studies that have investigated the association between iron intake or iron status and blood lead levels. These studies do not provide consistent findings. Schell et al. (2003) studied the effect of maternal diet during pregnancy on neonatal blood lead levels. Among the nutrients studied, iron had the largest impact on newborn lead levels: a two standard-deviation decrease in maternal iron intake (from 30.2 to 11.8 mg/day) was associated with a 0.51  $\mu\text{g}/\text{dL}$  increase in newborn lead (29% of the mean newborn lead level of 1.72  $\mu\text{g}/\text{dL}$ ). More than 50% of mothers in this study had intakes below the recommended dietary allowance for iron in pregnancy. However, data from a nationally representative population survey that included reproductive-aged women ( $N = 4,394$  women aged 20-49 years) found a positive association between dietary iron intake and blood lead levels (Lee et al. 2005).

### ***Dietary iron supplementation and lead***

Studies of the association between iron status and blood lead levels found that children with iron-deficiency had higher blood lead levels than iron-replete children (Markowitz et al. 1990; Wright et al. 1999, 2003). Consequently, many experts recommend that iron supplementation be prescribed only to iron-deficient children, irrespective of lead exposure, and do not recommend universal iron supplementation for the prevention or treatment of lead poisoning in children (Wright et al. 1999).

Iron supplementation has been shown to prevent lead-induced disruption of the blood-brain barrier during rat development (Wang et al. 2007a). The supplemental iron protected the blood brain barrier from changes in permeability caused by lead (Wang et al. 2007a) and was also protective against lead-induced apoptosis (Wang et al. 2007b). A prospective study of the effects of prenatal lead exposure on child development was carried out in Yugoslavia with outcomes assessed at age 4 years (Wasserman et al. 1994). Because 34% of the cohort was iron deficient (hemoglobin concentrations <10.5 g/dL at age 2 years and serum ferritin concentrations <12 ng/dL), iron supplements were provided when children were 18 to 38 months of age. Treatment of iron deficiency improved the hematological profile. Low-iron status and elevated lead exposure both affect infants' intellectual development. Lead exposure was associated with cumulative losses in cognitive function during the preschool years. Deficits attributable to iron-deficiency anemia at age 2 (Wasserman et al. 1992) appear to have been reversed by age 4 in response to iron supplementation.

Effectiveness and strategies for iron supplementation during pregnancy have been evaluated, indicating that the efficacy of the supplement intervention is dependent on the following: composition of the diet; presence of a condition, such as pregnancy, that would alter iron absorption or loss; composition of the supplement; severity of the iron deficiency at baseline; and the duration of the intervention (Beard 2000). There have been no supplementation trials addressing the effects of iron on lead levels in pregnancy and the research data are too scanty to determine the relationship between maternal iron intake and maternal or neonatal blood lead levels. However, given that iron deficiency is common among pregnant women (Kraemer and Zimmermann 2007), until further data are available, all women should be evaluated for the adequacy of their iron status and intake and be provided with appropriate nutritional advice and supplements if deficiencies exist.

### ***Iron status in U.S. women***

Pregnancy is the most at-risk period for developing iron-deficiency anemia (American College of Obstetrics and Gynecology 2008; Beard 2000). The current recommended intakes for iron are 27 mg in pregnant women and 10 mg in lactating women (Institute of Medicine 2001). While there is some uncertainty regarding the most useful indicators of iron status during pregnancy, cell indices (including mean cell volume, percent hypochromic red blood cells, percent reticulocytes, and cellular hemoglobin in reticulocytes) have been recommended as indicators of iron status (Ervasti et al. 2007), but their usefulness in diagnosing iron deficiency longitudinally needs to be confirmed.

Based on NHANES III data, 9% to 11% of adolescent girls and women of childbearing age were iron deficient [defined as having an abnormal value for at least two of three laboratory tests for iron status that included erythrocyte protoporphyrin, transferrin saturation, or serum ferritin] (Looker et al. 1997). Iron-deficiency anemia was found in 5% of women, which corresponds to an estimated 3.3 million U.S. women. Iron deficiency was more common among women who were from minority, low-income, and multiparous groups (Looker et al. 1997, 1999). Among women ages 19 through 50 years who participated in NHANES during the years 1988 through 1994, 72 ± 4% of pregnant women and 60 ± 4% of lactating women (Cogswell et al. 2003) were iron deficient. Use of supplements containing iron was associated with a significant reduction in the prevalence of iron deficiency among women ages 19-through-50 years, but the study lacked statistical power to make this assessment for pregnant and lactating women (Cogswell et al. 2003). Low-income women and minority women were less likely to consume supplements (Cogswell et al. 2003). Analyses of data from the Special

Supplemental Nutrition Program for Women, Infants, and Children in 12 U.S. states indicated that the prevalence of post-partum anemia was 27%, reaching 48% among non-Hispanic black women (Bodnar et al. 2001). Using NHANES III data, Bodnar et al. (2001) estimated that, among women with a poverty index ratio >130%, postpartum women (up to 12 months postpartum) had the highest rates of iron deficiency of between 12% and 13%. Mexican-American females have a higher prevalence of iron-deficiency anemia than did non-Hispanic white females (Frith-Terhune et al. 2000).

### **Summary**

Studies of the effect of iron supplementation in lead poisoned women are not available. Thus, iron supplementation in pregnant and lactating women should be consistent with those given for pregnancy and lactation. No additional iron supplementation is recommended for women with elevated BLLs. However, the iron status of all pregnant women should be evaluated and supplementation should be provided to correct any deficiency.

### **Zinc**

Deficiencies of other trace elements, such as zinc, may increase both lead absorption and lead toxicity (Cerklewski and Forbes 1976). Although of substantial importance worldwide (Black et al. 2008), zinc deficiency is not common in the United States (Hotz et al. 2003). Suboptimal zinc status may be caused by lack of zinc in the diet, but more likely is caused by inhibition of zinc absorption by factors such as other trace metals (e.g. iron, copper, lead, cadmium) (Lonnerdal 2000). Serum zinc concentration is influenced by multiple covariables and declines during pregnancy, presumably reflecting hemodilution that occurs during pregnancy (Hotz et al. 2003). In general, dietary protein is associated with increased zinc absorption and the U.S. population generally receives sufficient protein from dietary sources. Hence, zinc deficiency is not considered of major importance in altering susceptibility to lead toxicity in the U.S. population.

### **Ascorbic Acid (Vitamin C)**

Another category of nutrient-lead interactions involve nutrients noted for their antioxidant properties (e.g., ascorbic acid [vitamin C], vitamin E, selenium, thiamine). Antioxidants are involved in the prevention of cellular damage that occurs from free radicals (atoms or groups of atoms that can be formed when oxygen interacts with certain molecules). The role of the antioxidant nutrients in altering the outcomes of lead exposure is not well established. Supplementation with vitamin C and other antioxidants (such as vitamin E and selenium) may prevent lead-induced oxidative damage due to lead exposure and bolster the body's antioxidant defense system. Unfortunately, the research conducted to date is insufficient in either quality or quantity to evaluate many of these hypotheses.

In addition to its antioxidant properties, vitamin C has been suggested as acting as a natural chelating agent that enhances the urinary elimination of lead from the body (Simon and Hudes 1999). Two large cross-sectional studies in adults have found associations between blood lead levels and dietary intake or serum levels of vitamin C (Lee et al. 2005; Simon and Hudes 1999). In an analysis of nutritional data provided by over 15,000 adult participants in NHANES III, Simon and Hudes (1999) found that adults in the highest two serum vitamin C tertiles had a 65% to 68% lower prevalence of elevated blood lead levels compared to adults in the lowest tertile ( $p = 0.03$ ). In another analysis of NHANES III data, Lee et al. (2005) described the relationship between serum vitamin C and blood lead levels in over 4,000 reproductive-aged women (20–49 years). Women with high serum vitamin C levels had a 2.5 lower odds of having blood lead levels in the highest decile ( $>4 \mu\text{g/dL}$ ). Among postpartum women in Mexico City, higher intakes of vitamin C were associated with lower levels of breast milk lead (Ettinger et al. 2004).

Studies with human subjects have also found that supplementation with vitamin C reduced lead levels (Dawson et al. 1999). One study randomly assigned nonoccupationally exposed male smokers into three

treatment groups (placebo N = 25, Vitamin C 200 mg daily N = 25, and vitamin C 1,000 mg daily N = 25). Baseline blood lead levels were low and similar to that reported by other studies of the general population. Supplementation with 1,000 mg of vitamin C (but not 200 mg) reduced blood lead levels by 81% (Dawson et al. 1999). However, according to a literature review by Hsu and Guo (2002), the benefit of vitamin C supplementation seems to be found most consistently in studies with subjects with lower lead levels. Human and animal studies with higher blood lead levels in general tend to show minimal to no improvement with vitamin C supplementation.

Determining the dose of vitamin C needed to lower blood lead levels is unclear in that dose-response was not typically observed in these studies. Blood lead levels were lowered only in those studies which the vitamin C intake exceeded nutritionally recommended intakes. The safety of exceeding these levels is unclear. In summary, the research to date suggests that vitamin C may lower blood lead levels. However, further research is needed to confirm these conclusions, since the studies conducted to date have relatively small numbers of subjects and do not include pregnant or lactating women.

### **Vitamin D**

A final category of nutritional interactions with lead is interference by lead with formation of metabolites of the nutrient. The primary example of this is the severe compromise found in formation of the metabolites of vitamin D (i.e., the endocrine function of vitamin D) as lead exposure increases (Mahaffey et al. 1983; Rosen et al. 1980; Smith et al. 1981). Lead is well established as inhibiting the renal synthesis of 1,25-dihydroxyvitamin D in rats (Smith et al. 1981), chicks (Fullmer 1995), and young children (Rosen et al. 1980). As the body burden of lead increases (exposures associated with children's blood across blood lead concentrations of 12 to 120 µg/dL), there is a linear decline in 1,25-dihydroxyvitamin D (Mahaffey et al. 1983). To date, this interaction has not been evaluated among pregnant or lactating women.

Important sources of vitamin D are from synthesis of vitamin D through sunlight activation of pro-vitamin D present in skin and dietary intake (Holick 2007). Many factors influence the efficiency of cutaneous production of vitamin D. In winter months, ultraviolet B rays, needed to promote cutaneous vitamin D production, are absent at latitudes above 35° N (i.e., north of Memphis, Tennessee). Dark-skinned individuals require exposures about 5-10 times as long as light-skinned individuals to achieve similar levels of cutaneous vitamin D production. (Holick 2004). Even in summer months, sun exposures outside the peak sun hours of 10:00 AM to 3:00 PM have limited impact on cutaneous vitamin D synthesis (Holick 2003). Application of sunscreen blocks production of vitamin D (Holick 2007). Higher prepregnancy body mass index is associated with lower vitamin D status (Bodnar 2007a). Additionally, women who wear concealing clothing or are house-bound may have low vitamin D. Clinicians should therefore be aware of the potential for multiple risk factors for inadequate vitamin D status among certain recent immigrants who may not receive adequate exposure to sunlight.

### ***Vitamin D status in U.S. women***

The recommended adequate intake of vitamin D in both pregnant and lactating women is 200 IU. However, only about half of U.S. women ages 19-50 years get this amount of vitamin D daily from diet or supplement sources (Moore et al. 2004). The lowest mean dietary intakes of vitamin D in the U.S. population (based on data from food consumption patterns identified in the NHANES III and multiple years of the Continuing Survey of Food Intakes by Individuals [<http://www.ars.usda.gov/Services/docs.htm?docid=14392>]) were among teenage girls and women (Moore et al. 2004). The American Academy of Pediatrics (AAP) recommends that all children and adolescents receiving <400 IU/day from foods receive a supplement of 400 IU vitamin D daily (Wagner et al. 2008). In adults, daily supplementation with 400 IU vitamin D increases 25(OH)D by 7.0 nmol/L (Heaney 2003). Supplementation of a pregnant woman with 400 IU vitamin D, as in prenatal vitamins, has little effect on her 25(OH)D concentration (Wagner 2008).

Inadequate vitamin D status is common among women in the United States (Bodnar et al. 2007a,b; Hollis 2005; Hollis and Wagner 2004; Looker et al. 2008; Specker 2004; Specker et al. 1994). There is no universal consensus on adequate levels of 25-hydroxyvitamin D, but 75–80 nmol/L (Calvo and Whiting 2006) is a common benchmark. The AAP recommends that pregnant women maintain a 25(OH)D level of  $\geq 80$  nmol/L (32 ng/mL) (Wagner et al. 2008).

Based on NHANES 2000–2004 data, lower-than-optimal serum 25-hydroxyvitamin D levels were frequent (Looker et al. 2008); 49.1% of non-Hispanic white pregnant women, 76.4% of Mexican-American pregnant women, and 92.2% of non-Hispanic black pregnant women had serum 25-hydroxyvitamin D  $< 75$  nmol/L and 8.5%, 74.6%, and 41.6%, respectively, had serum 25-hydroxyvitamin D  $< 50$  nmol/L (Looker et al. 2008). Among a sample of pregnant women residing in northern United States, 25(OH) vitamin D levels were considered  $\leq 80$  nmol/L in 83.3% of black women and 47.1% of white women; more than 90% of these women used prenatal vitamins (Bodnar et al. 2007b).

### **Summary**

Because data on the association of lead and Vitamin D are limited, no specific recommendation is made for supplementation of vitamin D in lead poisoned pregnant or lactating women. Adequate levels of vitamin D should be maintained.

### **NUTRITIONAL ASSESSMENT AND REFERRALS**

All pregnant women should be assessed for the adequacy of their diets and be provided with appropriate nutritional advice and prenatal vitamins. This should be reinforced and maintained throughout pregnancy and lactation. General nutritional guidance is readily available; for example, see Dunlop et al. (2008) and Gardiner et al. (2008). Nutritional assessment of pregnant and lactating women with blood lead levels  $\geq 5$   $\mu\text{g/dL}$  should be, at a minimum, consistent with anticipatory guidance, evaluation, and nutritional recommendations for all pregnant and lactating women. However, in pregnant and lactating women with a current or past BLL  $\geq 5$   $\mu\text{g/dL}$ , certain nutritional recommendations should particularly be reinforced. Calcium and iron are of particular focus here for reasons that are related to how calcium and iron influence blood lead levels and pregnancy outcomes. A balanced diet with a dietary calcium intake of 2,000 milligrams daily should be maintained through diet, supplementation, or a combination of both. Additionally, iron status should be evaluated and supplementation provided in order to correct and prevent any iron deficiency. Anemia is the most easily identifiable indicator of functional iron deficiency. The Institute of Medicine (IOM) recommends starting iron supplementation after 12 weeks of pregnancy with the lowest dose needed. Women with anemia (defined in pregnancy as a hemoglobin level less than 11 g/dL in the first trimester and third trimester, and less than 10.5 g/dL in the second trimester), require higher dosing (Institute of Medicine 1990). Generally, pregnant women with iron deficiency anemia should be prescribed 60 to 120 mg of iron daily in divided doses. Dosage can be reduced to 30 mg daily once anemia is corrected. Women receiving supplemental iron or calcium should be encouraged to split the dose, taking no more than 500 mg of calcium or 60 mg of iron at one time, as only small amounts of these nutrients can be absorbed at any one time.

### **Referrals and Resources**

Practitioners who interact with pregnant or lactating women should routinely screen for the presence of nutrient deficiencies like iron deficiency. Although comprehensive assessment of dietary adequacy is not routinely conducted in medical office visits, all pregnant and lactating women should be screened for the adequacy of their diets. If the presence of dietary inadequacy is suspected, women should be provided appropriate nutritional advice and should be referred to resources designed to improve knowledge and/or access. Appendix XIII contains nutritional reference information, including dietary reference intakes: recommended vitamin and elements intakes for individuals, tolerable upper intake levels, food sources for key nutrients, dietary

assessment tools, and other background information. Resources that might be useful for referrals or interactions with patients are summarized in this section.

### **Registered dietitian**

A registered dietitian (RD) is a health professional who has received specialty training in food and nutrition. Using various dietary assessment tools, an RD can conduct a thorough assessment of an individual's dietary intake and can identify dietary inadequacies. Local RDs can be located by contacting local health care facilities, such as hospitals or health centers, or by using the Find A Nutrition Professional link of the American Dietetic Association Web site (<http://www.eatright.org>).

### **WIC**

The Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) is a federal grant program that provides nutritious foods, nutrition education, and referrals to low-income (at or below 185% of the U.S. poverty income guidelines) pregnant and lactating women (in addition to infants and children) who are at nutritional risk. The two major types of nutrition risk recognized for WIC eligibility are medically based risks—such as anemia, underweight, overweight, history of pregnancy complications, or poor pregnancy outcomes—and dietary risks—such as failure to meet the dietary guidelines or inappropriate nutrition practices.

In most WIC state agencies, WIC participants receive checks or vouchers to purchase specific foods each month that are designed to supplement their diets. The foods provided are high in one or more of the following nutrients: protein, calcium, iron, and vitamins A and C. These are the nutrients frequently lacking in the diets of the program's target population. Detailed information about WIC including eligibility criteria, contact information, and instructions for applying can be found on the WIC Web site (<http://www.fns.usda.gov/wic/>).

### **Supplemental Nutrition Assistance Program (formerly the Food Stamp Program)**

The Supplemental Nutrition Assistance Program (SNAP) is a federal program that provides low-income households with subsidies they can use like cash at most grocery stores. The assistance can be used to buy breads and cereals; fruits and vegetables; protein foods like meat, fish, and poultry; and dairy products. For additional information, call 1-800-221-5689 or visit the SNAP Web site (<http://www.fns.usda.gov/snap/>).

### **MyPyramid**

The USDA Center for Nutrition Policy and Promotion launched the MyPyramid for Pregnancy and Breastfeeding Web site in May 2008 (<http://www.mypyramid.gov/mypyramidmoms/>). This Web site allows pregnant and lactating women to create a personalized MyPyramid Plan for Moms that shows what and how much to eat from each food group during each trimester of pregnancy and each stage of breastfeeding. The site also provides additional information on nutritional needs during pregnancy and breastfeeding, weight gain during pregnancy and weight loss during breastfeeding, dietary supplements, food safety, and special health needs.

**Key Recommendations for Chelation Therapy**

- Chelation therapy should be considered for pregnant women with confirmed blood lead levels  $\geq 45$   $\mu\text{g}/\text{dL}$  on a case-by-case basis, in consultation with an expert in lead poisoning.
- Pregnant women with confirmed BLLs  $\geq 45$   $\mu\text{g}/\text{dL}$  should be considered as having high-risk pregnancies and managed in consultation with an expert in high-risk pregnancy.
- Pregnant women with life-threatening lead encephalopathy should be chelated regardless of trimester.
- Insufficient data exist regarding the advisability of chelation for pregnant women with BLLs  $< 45$   $\mu\text{g}/\text{dL}$ .
- Infants (0-6 months of age) with a confirmed BLL of  $\geq 45$   $\mu\text{g}/\text{dL}$  should be considered as candidates for chelation in consultation with an expert in pediatric lead chelation therapy.
- Before considering chelation therapy for a pregnant woman (or infant), blood lead levels should be repeated and confirmed using an additional venous blood lead sample collected within 24 hours.
- Chelation therapy must occur in a lead-safe environment; therefore, prior to initiating chelation therapy, the patient should be removed from further lead exposure (see Chapter 6).

**INTRODUCTION**

There is a potential role for chelation therapy to treat pregnant woman and newborns, and, in some cases, chelation may be life-saving. However, the scientific evidence to support its use is very limited, and chelation during pregnancy and in the early postpartum period should be initiated only in consultation with an expert in treatment for lead poisoning.

**OVERVIEW OF CHELATION**

Chelation therapy utilizes the chemical characteristics of a chelating agent to remove lead from participation in biological reactions in the body, by binding the agent with the metal (lead) to form a chelate. A chelate is defined as a “complex formation involving a metal ion and two or more polar groupings of a single molecule” (Stedman’s 2008). Notice that this definition does not indicate the fate of the chelated metal. Possibilities include excretion of the chelate, persistence in the tissue where the bonding occurred, or redistribution to other tissues. Ideally, the drug should effectively increase lead excretion, be easily administered, be affordable, and be safe. The consequences of lead removal should be to halt further toxicity and to reverse previous lead effects (Markowitz 2000).

**DRUGS AVAILABLE IN THE UNITED STATES**

There are four drugs ( $\text{CaNa}_2\text{EDTA}$ , DMSA, BAL, PCA) in use for lead chelation in the United States (Table 8-1) and others are in use elsewhere. None of these drugs specifically bind only lead and, thus, some loss of essential elements also occurs. The toxicity profiles of these drugs differ. Two of the drugs are administered orally (DMSA, PCA) and two must be given parenterally (BAL im only;  $\text{CaNa}_2\text{EDTA}$  im or iv). The latter two require expert nursing care and are always used in the hospital. The former two are used in both inpatient and outpatient settings. All of these drugs increase lead excretion, primarily through the kidneys (Aposhian 1982; Graziano et al. 1999). There may also be tissue redistribution during or as a consequence of chelation.

The introduction of chelating agents for the treatment of severe lead poisoning (blood lead  $\geq 70$   $\mu\text{g}/\text{dL}$ ) was associated with a marked decline in lead-related mortality in children, from 30% to  $<1\%$  (Chisolm 1968). Chelation treatment at lower blood lead levels, where mortality is not a major concern, is associated with a fall in blood lead levels and an improvement in biochemical markers of lead toxicity, such as erythrocyte protoporphyrin (EP) levels and delta-aminolevulinic acid dehydratase (ALAD) activity (Graziano et al. 1991; Piomelli 1996). Depending on the amount of lead in the body prior to chelation, the effect of treatment on blood lead is generally temporary, with levels increasing within 2 weeks after the conclusion of a course of treatment in many patients. The effect on the biochemical markers of toxicity is disparate. ALAD activity declines as blood lead rebounds, whereas EP levels tend to fall if no further lead absorption occurs, despite the rebound in blood lead. All of the drugs increase the excretion of essential metals, but to differing degrees. DMSA appears to be the most specific for binding heavy metals such as lead and mercury. The excessive loss of essential metals has been postulated to account for the observed teratogenicity associated with all of the agents tested in animal studies.

### **Utility of These Drugs in Other Populations**

Candidates for chelation therapy differ by age group. Previous CDC guidelines (1991) established a blood lead level of  $\geq 45$   $\mu\text{g}/\text{dL}$  as the indication for treatment of children regardless of symptoms. At these levels, gastrointestinal symptoms may occur in a large number of children; biochemical toxicity is demonstrable in the majority of children (elevated EP level, decreased ALAD activity); and, subclinically, cognitive scores are likely lower. Additionally, and of importance, such children are very likely to excrete large amounts of lead in response to chelation treatment—much greater amounts than they would spontaneously excrete over periods of time comparable to a course of chelation. However, the amount excreted is only a small fraction of the total lead in the body. Though symptoms and biochemical markers of toxicity may improve post chelation, there is no documentation of cognitive improvements in nonencephalopathic children. For blood lead levels of  $<45$   $\mu\text{g}/\text{dL}$ , chelation treatment can also lower blood lead levels and improve biochemical markers of toxicity temporarily. However, there is no evidence that lead excretion is substantially increased for the majority of children. A randomized placebo-controlled trial of succimer for children with initial BLLs of 20–44  $\mu\text{g}/\text{dL}$  also failed to demonstrate any difference in mean cognitive scores when tested 2 years later (Rogan et al. 2001). There are no published guidelines identifying a specific blood lead level as requiring chelation therapy in adults nor is there a universal protocol for which agents to use, dose, or duration of treatment.

### **CONCERNS ABOUT CHELATION THERAPY DURING PREGNANCY**

Consideration of chelation therapy during pregnancy requires identification of the targeted beneficiary and estimation of the anticipated benefits and risks. Limited availability of research findings on comparable patients means that extrapolation from data on other types of patients are necessary to make treatment decisions. Since the correlation between maternal and newborn blood lead levels is high as measured by cord and maternal blood lead levels determined at delivery, maternal blood lead level can be used as a proxy for the fetus' blood lead level. Therefore, if the known risks and benefits of chelation treatment for lead poisoned children are extrapolated to fetuses, then a blood lead level  $\geq 45$   $\mu\text{g}/\text{dL}$  in the mother's blood would trigger chelation treatment of the fetus in situations where the fetus is the intended beneficiary of the treatment. If the intended beneficiary of chelation therapy is the pregnant woman, then there is insufficient clinical data to guide decisions about treatment by blood lead level in the absence of symptoms.

No chelation-attributable toxicities have been reported in the existing published case reports. However, very limited information is available to understand any potential short- or long-term effects. Use of chelating agents should therefore only be considered in consultation with experts in lead poisoning and high risk pregnancies.

## CLINICAL EVIDENCE IN PREGNANCY AND IN THE NEWBORN

The literature search identified only case reports of chelation therapy during pregnancy (see Table 8-2) and early postpartum (see Table 8-3). In general, maternal blood lead levels decline after a course of chelation and neonatal blood lead levels at birth were also lower than peak maternal levels during the pregnancy. However, very limited information is available to determine if any long term benefit is derived from *in utero* treatment or whether adverse effects occur from chelation. In the few case reports, babies did not appear to have gross developmental delays.

The women in the case reports were selected for chelation therapy based on their blood lead levels with the lowest pretreatment level reported as 44 µg/dL, although in that case a prior blood lead of 62 µg/dL was observed. All women appeared to have been treated during the second half of pregnancy. All but one of the women were treated with varying amounts and for varying durations with  $\text{CaNa}_2\text{EDTA}$ . A single patient also received BAL in addition to  $\text{CaNa}_2\text{EDTA}$ . A single case reported the exclusive use of DMSA. In all cases,  $\text{CaNa}_2\text{EDTA}$  therapy was associated with a decline in maternal blood lead levels. There was no change in maternal blood lead after the one case of treatment with DMSA (18-day course). However, she was treated as outpatient without apparent oversight for either compliance or ongoing lead exposure. In all but one case a healthy newborn was delivered. The exception occurred in a case where maternal blood lead pretreatment was 104 µg/dL. The woman received  $\text{CaNa}_2\text{EDTA}$  and BAL. The 1.6 kg infant was born prematurely after antepartum hemorrhage 36 hours into treatment. This baby was later noted to have developmental delay and hearing deficit. No consistent pattern in cord blood lead levels was apparent in the few cases where they were reported. The interval between chelation and delivery also varied from months to minutes. Cord blood lead levels were higher than maternal blood lead in the case treated with DMSA and in that of the sick premature infant described. In the other cases cord blood lead levels were lower than maternal prechelation levels. In several reports, chelation treatment was not initiated until shortly before or soon after delivery and was directed toward the newborns. Various drugs at full dosages have been used singly or in combination:  $\text{CaNa}_2\text{EDTA}$  alone,  $\text{CaNa}_2\text{EDTA}$  and BAL,  $\text{CaNa}_2\text{EDTA}$  and DMSA, and DMSA alone. In general, chelation therapy was well tolerated by the infants.

Exchange transfusion has been used, in combination with chelation therapy, to successfully lower blood lead levels in neonates (Hamilton et al. 2001; Mycyk and Leikin 2004). In one case report, after a single-volume exchange transfusion, the infant with a cord blood lead level of 100 µg/dL was chelated on day 2 with a combination of BAL and  $\text{CaNa}_2\text{EDTA}$  for 5 days, at the end of which the blood lead was 37 µg/dL (Mycyk and Leikin 2004). Chelation was continued for 19 days with DMSA, at the end of which the infant's blood lead was 38 µg/dL. Both the exchange and chelation treatments were described as "well tolerated." Of particular interest in this case is that maternal blood lead at preconception was 117 µg/dL and declined to 72 µg/dL by the third trimester. The mother was not chelated during her pregnancy. The baby was delivered at 40 weeks with a blood lead level of 100 µg/dL, weighed 3.7 kg, and achieved normal developmental milestones at 1 month of age. Another case report (Hamilton et al. 2001) describes a double-volume exchange transfusion plus 5 days intravenous  $\text{CaNa}_2\text{EDTA}$  where the infant blood lead of 114 µg/dL fell to 12.8 µg/dL immediately following the exchange transfusion. Caution is advised, however, as Bearer et al. (2000, 2003) report on blood transfusions in newborn premature infants as an unexpected source of lead exposure. The relative benefits/risks of chelation versus exchange transfusion have not been investigated.

## SUMMARY AND RECOMMENDATIONS REGARDING CHELATION THERAPY

While chelation may be beneficial especially in protecting the mother with very elevated blood lead levels, given the lack of controlled studies and the paucity of even published case reports or series, chelation therapy should be undertaken only with advice from experts in this field. Such decision making should weigh the lack of definitive evidence of safety for the fetus (especially in the first trimester) against the extensive safety profile

and experience with these drugs in children and adults. Recommendations for chelation therapy prenatally and postnatally are presented below:

### **Prenatal Chelation of the Mother**

BLLs  $\geq 70$   $\mu\text{g}/\text{dL}$  may result in significant maternal toxicity and chelation therapy should be considered, regardless of trimester, in consultation with an expert in the management of lead poisoning, high-risk pregnancies, and neonatology. Lead poisoning may be life threatening at levels greater than 100  $\mu\text{g}/\text{dL}$ , though many cases have been described where patients with such levels were asymptomatic. Encephalopathic pregnant women should be chelated regardless of trimester.

Pregnant women with confirmed BLLs  $\geq 45$   $\mu\text{g}/\text{dL}$  (repeated on at least two venous blood samples collected within 24 hours) may be considered for chelation therapy and should be managed in conjunction with experts in high-risk pregnancy and lead poisoning. Immediate removal from the lead source is still the first priority and, in some cases, pregnant women may require hospitalization. When chelation is being considered, it should be performed in an inpatient setting only with close monitoring of the patient and in consultation with a physician with expertise in the field of lead chelation therapy. Data regarding the reproductive risk associated with chelation during pregnancy are sparse. Most case reports of infant outcomes report on the use of chelating agents after the first trimester (see Table 8-2). Reserving the use of chelating agents for later in pregnancy is consistent with the general concern about the use of unusual drugs during the period of organogenesis (National Research Council, 2000). However, severe maternal lead intoxication, such as encephalopathy, will warrant chelation regardless of the stage of pregnancy. (Contact the CDC Healthy Homes and Lead Poisoning Prevention branch [<http://www.cdc.gov/nceh/lead>] or the American College of Medical Toxicology [<http://www.acmt.net>] for a list of experts).

### **Neonatal Chelation of the Infant**

Chelation should be considered in neonates and infants less than 6 months of age for a confirmed BLL  $\geq 45$   $\mu\text{g}/\text{dL}$  in consultation with a pediatric expert in lead chelation therapy. The limited data published suggest that toxicities for 0- to 6-month-olds are no different than those of 6- to 12-month-olds. Chelation treatment must occur in an environment free of lead hazards; therefore, prior to initiating chelation therapy, the patient should be removed from further lead exposure. Very limited data are available on the use of exchange transfusion as an alternative in this age group.

### **Chelating Agents**

Three of the four available chelating agents ( $\text{CaNa}_2\text{EDTA}$ , BAL, DMSA) have been used during pregnancy and may be considered. Data for penicillamine used in pregnancy are unavailable. (This drug is FDA-approved for use in children, but its use in pregnancy is not approved.) The most experience, little as it is, has been with  $\text{CaNa}_2\text{EDTA}$ . This drug may be used intravenously at regular doses for 5 days. [Important Note: Calcium edetate ( $\text{CaNa}_2\text{EDTA}$ ) must not be confused with edetate disodium ( $\text{Na}_2\text{EDTA}$ ). From 2003 to 2005, three individuals—including two children—died of cardiac arrest caused by hypocalcemia during chelation therapy, as a result of inadvertent treatment with edetate disodium ( $\text{Na}_2\text{EDTA}$ ) (Brown et al. 2006).]

**Table 8-1. Chelating Agents Used to Treat Lead Poisoning**

Name	Synonym(s)	Chemical Name	Number of Reported Cases <sup>a</sup> Used in Pregnancy
Calcium Ederate <sup>b</sup>	Calcium disodium versenate, versenate, edetate disodium calcium (CaNa <sub>2</sub> EDTA)	Calcium disodium ethylene diamine tetraacetate	6
Succimer <sup>c</sup>	Chemet <sup>TM</sup> , meso-2,3-dimercaptosuccinic acid (DMSA)	Meso 2,3-dimercaptosuccinic acid	1
BAL <sup>d</sup>	Dimercaprol, British anti-Lewisite, BAL in Oil (BAL)	2,3-dimercapto-L-propanol	1
D-penicillamine	Penicillamine, PCA, cuprimine (D-pen)	3-mercapto-D-valine	0

<sup>a</sup>See Tables 8-2 and 8-3 for details of the case reports

<sup>b</sup>Never use edetate disodium (Na<sub>2</sub>EDTA) alone without calcium (Brown et al. 2006)

<sup>c</sup>Succimer did not lower BLL after 1 course of treatment (Horowitz et al. 2001)

<sup>d</sup>Used together with Calcium Ederate (CaNa<sub>2</sub>EDTA) (Tait et al. 2002)

**Table 8-2. Published Experience with Chelating Agents During Pregnancy in Humans**

Authors/Location/Year Published	Blood Lead ( $\mu\text{g/dL}$ )	Timing of Chelation	Drug Used Dose/Route	Biochemical Outcome	Chronic vs. Acute	Clinical History/Reported Outcomes
Abendroth et al./Germany/1971	80	5th month	CaNa <sub>2</sub> EDTA 0.5 g/day iv 3x/wk w/ly for 4wks	BLL 30 $\mu\text{g/dL}$ at end of chelation	Acute (3 wks)	"Good health" at 4 years of age
Angle and McIntyre/Nebraska/1964	240	8th month	CaNa <sub>2</sub> EDTA 75 mg/kg/d, iv/7d	At delivery 4 wks post Rx: urinary copropor. negative in mother and baby	Chronic	4 wks post-treatment, cord BLL <60 $\mu\text{g/dL}$ ; "normal neurological and developmental assessment at 4 years of age"
Timpo et al./New York/1979	86	8th month	CaNa <sub>2</sub> EDTA 1 g/iv bid/3d	BLL >41 2d post Rx; 26 $\mu\text{g/dL}$ 1 wk postpartum	Chronic	8 days post-treatment, cord BLL 60 $\mu\text{g/dL}$ ; BLL 72 at 2 wks postpartum. 38 wks gestation, wt 2.665 g, length 45 cm, hc 32 cm (all within normal limits), "normal developmental evaluation at 18 months of age"

### **Key Considerations for Breastfeeding**

- Human breast milk is specific to the needs of the infant and is the most complete and ideal source for infant nourishment in the first year of life.

### **Key Recommendations for Initiation of Breastfeeding**

- Measurement of levels of lead in breast milk is not recommended.
- Mothers with BLLs  $<40 \mu\text{g/dL}$  should breastfeed.
- Mothers with confirmed BLLs  $\geq 40 \mu\text{g/dL}$  should begin breastfeeding when their blood lead levels drop below  $40 \mu\text{g/dL}$ . Until then, they should pump and discard their breast milk.
- These recommendations are not appropriate in countries where infant mortality from infectious diseases is high (World Health Organization Collaborative Study Team on the Role of Breastfeeding on the Prevention of Infant Mortality 2000).

### **Key Recommendations for Continuation of Breastfeeding**

- Breastfeeding should continue for all infants with BLLs below  $5 \mu\text{g/dL}$ .
- Infants born to mothers with BLL  $\geq 5 \mu\text{g/dL}$  can continue to breastfeed unless there are indications that the breast milk is contributing to elevating BLLs. These infants should have blood lead tests at birth and be followed according to the schedule in Chapter 5.
- For infants whose blood lead levels are rising or failing to decline by  $5 \mu\text{g/dL}$  or more, environmental and other sources of lead exposure should be evaluated. If no external source is identified, and maternal BLLs are  $>20 \mu\text{g/dL}$  and infant BLL  $\geq 5 \mu\text{g/dL}$ , then breast milk should be suspected as the source, and temporary interruption of breastfeeding until maternal blood lead levels decline should be considered.

### **Key Recommendations for Use of Reconstituted Infant Formula**

- Infant formula requiring reconstitution should be made only with water from the cold water tap. Flush the tap for at least 3 minutes before use and then heat the water or use bottled or filtered tap water known to be free of lead.

Breastfeeding is an optimal infant feeding practice compared with other infant feeding practices which carry risks. With regard to short-term risks, lack of breastfeeding is associated with increases in common childhood infections, such as diarrhea (Chien and Howie 2001) and ear infections (Ip et al. 2007), with potentially serious complications such as meningitis, dehydration, and hearing impairment. Lack of breastfeeding also increases the risk for some relatively rare but severe infections and diseases, such as severe lower respiratory infections (Bachrach et al. 2003; Ip et al. 2007), leukemia (Ip et al. 2007; Kwan et al. 2004), and—especially important for preterm infants—necrotizing enterocolitis (Ip et al. 2007). The risk of hospitalization for lower respiratory tract disease in the first year of life is more than 250% higher among babies who are formula fed compared with those who were exclusively breastfed at least 4 months (Bachrach et al. 2003). Furthermore, the risk for Sudden Infant Death Syndrome is 56% higher among formula-fed versus breastfed infants (Ip et al. 2007). The Agency

for Healthcare Research and Quality (2007) report also concludes that formula feeding has long-term health effects related to increased risks for certain chronic diseases and conditions, such as type 2 diabetes (Owen 2006) and childhood obesity (Arenz et al. 2004), both of which have increased among U.S. children over time.

Decisions made with regard to breastfeeding by a mother whose blood lead levels exceed background levels should be based on scientific evidence suggesting undue risk for the child. Scientific observations have consistently shown that biologically significant elevations in milk lead concentration do not occur in lactating women at the blood lead concentrations typical of women with long-term residence in developed countries. Only a small number of American women will meet the criteria to defer breastfeeding, though more will be subject to additional follow up out of an abundance of caution. Transfer of lead can occur from maternal plasma to breast milk in roughly the same concentrations. This chapter describes recommendations for breastfeeding by women with blood lead levels above background levels and summarizes the scientific evidence supporting these recommendations.

## **INTRODUCTION**

The overall goal in counseling a woman whether or not to breastfeed is to provide the best possible nutritional and nurturing environment for the infant. Any decision either not to initiate or to discontinue breastfeeding must be made only after careful consideration of all the factors involved. The basis of the initial decision-making process should include a thorough discussion between the mother and her health care provider of the factors to be considered. This discussion should ideally take place before the baby is born. Many factors have an impact on whether or not a woman with a blood lead level  $\geq 5$   $\mu\text{g/dL}$  chooses to breastfeed her child. Many of these factors are poorly quantified and others are not readily quantifiable. Thus, a detailed and balanced discussion is essential.

## **THE IMPORTANCE OF BREASTFEEDING**

Due to the unique nutritional characteristics of human milk, breastfeeding is understood to be the optimal mode of nutrient delivery to term infants. The U.S. Department of Health and Human Services' Blueprint for Action on Breastfeeding (U.S. Department of Health and Human Services 2000) emphasizes the value of breastfeeding, as does AAP (American Academy of Pediatrics 2005). Human breast milk is specific to the needs of the human infant. It provides the ideal nutrients for human growth and development in the first year of life, in a form that is readily transferred into the infant's bloodstream. Human milk also protects the breastfed infant against certain common infections and reduces the incidence of certain chronic diseases as well as symptoms of allergy (U.S. Department of Health and Human Services 2000). Women who breastfeed experience less postpartum bleeding, earlier return to prepregnancy weight and a reduced risk for ovarian cancer and premenopausal breast cancer (U.S. Department of Health and Human Services 2000). Breastfeeding also provides the added benefit of the mother-child bonding that takes place during nursing sessions.

The decision to breastfeed in the presence of a possible contraindication should be made on an individual basis, considering the risk of the complication to the infant and mother versus the tremendous benefits of breastfeeding (Lawrence 1997; Lawrence and Lawrence 2005).

The current AAP statement on breastfeeding does not address the issue of breastfeeding by mothers with lead exposure above background levels (American Academy of Pediatrics 2005). An earlier statement specifically addressing the transfer of toxic environmental agents through breast milk and the risk of infant exposure to environmental toxicants by this route suggests that before advising against breastfeeding, the practitioner should weigh the benefits of breastfeeding against the risks of not receiving human milk (American Academy of Pediatrics 2001).

Specifically with regard to lead, a technical information bulletin published by the Health Resources and Services Administration in 1997 held that breastfeeding is not contraindicated unless the concentration of lead in

maternal blood exceeds 40 µg/dL (Lawrence 1997). This recommendation was one small section of a larger review of the evidence then available on breastfeeding benefits and contraindications. It has not been updated since publication.

## **LEAD IN BREAST MILK**

Since maternal blood is the medium from which lead is transferred to breast milk and ultimately to the nursing infant, the relationship of lead in maternal blood to lead in breast milk is of key importance. Early studies supported the belief that milk lead levels were one-tenth to one-fifth the levels of lead in maternal whole blood (for a review, see Abadin et al. 1997). These high values were due in part to contamination and analytical inaccuracies in the laboratory measurement of lead in breast milk. (See Chapter 3 for discussion of issues associated with laboratory analysis of lead in human milk.)

Recent carefully conducted studies of lead in breast milk consistently show breast milk lead to maternal blood lead ratios of approximately 3% or less; that is, a milk lead concentration of 3 µg/dL (or 30 µg/L) would be associated with a maternal blood lead concentration of 100 µg/dL, or a milk lead concentration of 0.3 µg/dL (3 µg/L) would be associated with a maternal blood lead concentration of 10 µg/dL. Gulson et al. (1998) found that the breast milk lead to blood lead ratio was less than 3% in 15 adult female immigrants to Australia with blood lead concentrations up to 34 µg/dL. Li et al. (2000) evaluated 119 nonoccupationally exposed women in Shanghai, reporting a mean maternal blood lead concentration of 14.3 µg/dL and a mean milk lead to blood lead ratio of 3.9%. Counter et al. (2004) reported ratios of milk lead concentration to maternal blood lead concentration in 13 nursing mothers from Ecuadorian Andean villages. The ratios ranged from 0.4% to 3.3% in 12 of the subjects, appearing to increase with increasing blood lead level. The thirteenth subject, with a blood lead concentration of 27.4 µg/dL, had a milk lead to blood lead ratio of 7.5%. Ettinger et al. (2004a) showed that breast milk lead was significantly correlated with maternal blood lead at one month postpartum in 310 lactating women in Mexico City. The ratio of the geometric mean milk lead concentration to the geometric mean maternal blood lead concentration was 0.013, or 1.3%, and the highest observed blood lead concentration was 29.9 µg/dL.

There is limited evidence that with closely spaced multiple pregnancies, baseline maternal blood lead concentrations are lower and the increases in maternal blood lead concentrations occurring during late pregnancy and lactation are reduced relative to those in the first pregnancy (Manton et al. 2003; Rothenberg et al. 1994). However, for most women in the United States, more than 98% of whom have blood lead levels <5 µg/dL, this has no practical implications.

## **INFANT LEAD EXPOSURE FROM BREAST MILK**

Limited experimental observations suggest that breast milk lead has a relatively small impact on infant blood lead. It is generally agreed that biologically significant elevations in milk lead concentration do not occur in lactating women at the blood lead concentrations typical of women with long-term residence in developed countries (Gulson et al. 2003; Manton et al. 2003; Sowers et al. 2002). Other sources of lead also contribute to the nursing infant's blood lead level. Manton et al. (2000) concluded from lead isotope analyses that the principal source of lead exposure in very young children, irrespective of whether they are breast- or bottle-fed, is hand-to-mouth activity. However, the relative importance of early hand-to-mouth activity depends on the child's environment. Neonatal bone turnover is another potential source of lead in infant blood (Gulson et al. 2001) that should be factored into expectations about infant blood lead levels. Bone turnover is very high in the newborn because both bone accretion and bone loss during reshaping of the growing bone are high. The rapid turnover of bone lead is reflected in a short blood lead half-life in very young children compared to older children, with bone turnover varying by age, rather than to the length of the exposure (Manton et al. 2000; O'Flaherty 1995).

Although levels of lead in breast milk are generally low, they can influence infant blood lead levels over and above the influence of maternal blood to which the infant was exposed *in utero*. In a large-scale study of breast milk and infant blood lead levels, milk lead was found to account for 10% of the variance in 6-month blood lead and there was a linear dose–response relationship between breast milk lead and infant blood lead at age 6 months (Rabinowitz et al. 1985). In another study, breast milk lead accounted for 12% of the variance of infant blood lead levels at 1 month of age and levels of breast milk lead were significantly correlated with infant blood lead (Ettinger et al. 2004<sup>b</sup>).

It is possible to estimate milk lead concentrations associated with various maternal blood lead concentrations. As discussed above, the most probable value of the maternal milk lead to blood lead ratio is substantially less than 3%. Table 9-2 illustrates calculated milk lead concentrations at various maternal blood lead concentrations assuming breast milk lead concentration to be 3% of maternal blood lead concentration. Employing a tenfold larger percentage, this calculation might be thought of as providing an upper limit on the milk lead associated with a given maternal blood lead. It partly offsets the effect of binding of lead to milk casein at very low concentrations.

From the breast milk lead, that portion of the nursing infant's blood lead originating from maternal milk can be estimated. Ettinger et al. (2004b) reported that an increase of about 2 µg/L in breast milk lead was associated with a 0.82 µg/dL increase in the blood lead of breast-fed infants at 1 month of age, adjusting for cord blood lead, infant weight change, and reported breastfeeding status. Calculated based on this observed relationship, the increase in infant blood lead concentration associated with different maternal blood lead concentrations can be estimated (Table 9-3). Based on this calculation, the predicted contribution of breast milk lead to infant blood lead at 1 month of age would be about 3.7 µg/dL at a maternal blood lead concentration of 30 µg/dL, 2.5 µg/dL at a maternal blood lead concentration of 20 µg/dL, or 0.25–0.5 µg/dL at maternal blood lead concentrations of 2–4 µg/dL. This calculation is based on a data set whose values did not exceed 30 µg/dL. Its application outside this range represents an extrapolation and becomes progressively less certain as maternal blood lead increases above 30 µg/dL. These calculations are supported by observational data only in infants about 1 month old, but they do not suggest undue concern for lead exposure of nursing infants at maternal blood lead and breast milk lead concentrations typical of those found in the United States.

Evidence also suggests that the breast milk lead to maternal blood lead ratio may increase in a nonlinear fashion when maternal blood lead concentrations exceed about 40 µg/dL. This hypothesis is supported both by observational data on women with very high breast milk lead concentrations (Li et al. 2000; Namihara et al. 1993) and by studies on the components of the blood (e.g., plasma) and breast milk as they relate to maternal lead exposure (Hernandez-Avila et al. 1998; Manton and Cook 1984; Manton et al. 2001; O'Flaherty 1993; Schutz et al. 1996). A finding that breast milk contains proportionally more maternal lead at higher blood lead levels suggests possible risk associated with breastfeeding at maternal blood lead levels above 40 µg/dL. Epidemiological evidence is not entirely consistent about the extent to which maternal blood lead concentrations increase during lactation (Ettinger et al. 2006; Manton et al. 2003; Tellez-Rojo et al. 2002).

The breastfeeding recommendations developed herein are intended for women living in the United States. Insufficient data are available to guide clinical decisions regarding women with extremely high breast milk lead concentrations or in women living or working in lead-polluted areas outside the United States. Some evidence suggests different rates of transfer of lead into breast milk for maternal blood lead concentrations less than and greater than about 40 µg/dL (Li et al. 2000), but available human data are insufficient to make reliable estimates.

## RECOMMENDATIONS FOR BREASTFEEDING

On the basis of the health and developmental benefits to infants of breastfeeding and consideration of the available research on the contribution of breast milk lead to infant blood lead, CDC has developed clinical

guidance for breastfeeding by women exposed to lead. Initial criteria for breastfeeding are maternal blood lead levels, but ongoing monitoring of infant blood lead levels (described in Chapter 5) provides the additional feedback loop needed for clinical decision making about continuing breastfeeding. Specifically, a rise in infant BLL of 5  $\mu\text{g}/\text{dL}$  or more is regarded as clinically significant and affects breastfeeding recommendations. Testing recommendations for women with BLL  $\geq 5 \mu\text{g}/\text{dL}$  identified during pregnancy or at delivery are presented in Table 9-1 and for infants in Tables 5-1 and 5-2. Measurement of breast milk lead is not recommended given current laboratory methods and the availability of maternal blood lead as a proxy.

An important practical challenge to clinicians in implementing these recommendations is ensuring that the recommended laboratory and other findings are entered into both the mother's and the infant's medical records in a timely fashion, as noted in Chapter 5. For instance, the mother's initial and sequential blood lead levels should be in the infant's chart. Without this data, clinicians lack the information needed to provide appropriate and real-time guidance about breastfeeding.

### **Initiating Breastfeeding**

Initiation of breastfeeding should be encouraged for all mothers with blood lead levels  $<40 \mu\text{g}/\text{dL}$ , with follow-up recommendations varying by blood lead levels. Initial maternal BLLs  $<20 \mu\text{g}/\text{dL}$  are unlikely to be associated with a detectable increase in infant blood lead, even using a ratio of breast milk to maternal blood ten times the most likely value, as in the above calculations. In women with BLLs between 5-19  $\mu\text{g}/\text{dL}$ , an initial infant blood lead level is warranted to establish a baseline.

At maternal blood lead levels between 20-39  $\mu\text{g}/\text{dL}$ , data do not exist to weigh accurately the risks of lead exposure from breast milk against the benefits of breastfeeding. Thus, a prudent course of action is for these women to initiate breastfeeding accompanied by sequential mother and infant blood lead levels to monitor trends, so that adjustments can be made if indicated. Mothers with BLL between 20-39  $\mu\text{g}/\text{dL}$  should be retested 2 weeks postpartum and then at 1- to 3-month intervals, depending on the direction and magnitude of trend in infant blood lead levels (Table 9-1).

CDC considered the adverse health and developmental effects associated with lead exposure compared to those associated with not breastfeeding and, based on the available information, determined that at maternal blood lead levels  $\geq 40 \mu\text{g}/\text{dL}$  the adverse developmental effects of  $\geq 5 \mu\text{g}/\text{dL}$  increase in an infant's blood lead level was of greater concern than the risks of not breastfeeding until maternal blood lead level dropped  $<40 \mu\text{g}/\text{dL}$ . Mothers with blood lead levels  $\geq 40 \mu\text{g}/\text{dL}$  should not initiate breastfeeding immediately. They should be advised to pump and discard their breast milk until their blood lead levels drop below 40  $\mu\text{g}/\text{dL}$ . In such cases, infants' blood lead levels should be monitored after the initiation of breastfeeding. This recommendation reaffirms the prevailing guidance about deferring breastfeeding at maternal BLL  $\geq 40 \mu\text{g}/\text{dL}$ .

### **Continuing Breastfeeding**

All infants born to mothers with BLL  $\geq 5 \mu\text{g}/\text{dL}$  should have blood lead tests at birth and be followed according to the schedule in Chapter 5. Breastfeeding should continue for all infants with BLLs below 5  $\mu\text{g}/\text{dL}$  or trending downward.

For breastfed infants whose blood lead levels are rising or failing to decline by 5  $\mu\text{g}/\text{dL}$  or more, environmental and other sources of lead exposure should be evaluated. If no external source is identified, and maternal BLLs are  $>20 \mu\text{g}/\text{dL}$  and infant BLL  $\geq 5 \mu\text{g}/\text{dL}$ , then breast milk should be suspected as the source, and temporary interruption of breastfeeding until maternal blood lead levels decline should be considered. There are insufficient data to estimate how many mother-child pairs would meet these criteria, but anecdotal evidence suggests that it would apply to a very small number in the United States.

Follow-up testing of women with BLL  $\geq 5$   $\mu\text{g}/\text{dL}$  identified during pregnancy or at delivery should follow the schedule outline in Table 9-1. This should include women with known risk factors that are not controlled, regardless of the BLL of the women or their infants.

### **Lead in Infant Formula**

Since breast milk may not be provided exclusively, for an extended period of time, or even at all, many infants are likely to be nourished, at least in part, by commercially available infant formula. Therefore, it is important to characterize the contribution of non-breast milk sources to total potential lead exposure from dietary intake in infants and young children.

Over the past several decades, the FDA and other federal agencies have worked to reduce dietary and other lead exposures of the general population, and in particular of vulnerable subpopulations such as infants, children, and pregnant women (Bolger et al. 1996). Lead-lined and lead-soldered cans are no longer used for commercial infant formula produced in the United States, and the most recent Total Diet Study confirms that currently marketed milk-based ready-to-feed infant formulas in the United States contain no appreciable amounts of lead. Only one sample (in the high-iron category) of 88 samples of high- and low-iron infant formula contained any measurable lead (trace lead detected in 1 sample = 0.007 mg/kg) (U.S. Food and Drug Administration 2007).

To the extent that lead can be found in infant formula, the relative bioavailability of such lead may be less than that of lead in breast milk. For example, it has been documented that iron is more readily absorbed from breast milk than from infant formula (Lonnerdal 1985). Rabinowitz et al. (1985) found breast milk to be the strongest correlate of 6-month blood lead levels while formula lead correlated poorly with infant blood lead levels. However, Gulson et al. (1998) showed that the contribution of formula to infant blood lead varied from 24% to 68% in exclusively formula-fed infants. They later estimated average daily intake of lead at age 6 months for infants in their Australian study group fed exclusively by breast milk to be 0.73  $\mu\text{g}$  (subjects = 17; observations = 78), and for infants fed exclusively by infant formula to be 1.8  $\mu\text{g}$  (subjects = 11; observations = 42) (Gulson et al. 2001). Ettinger et al. (2004b) also found that infants fed exclusively with breast milk had lower blood lead levels than those fed partially with breast milk, suggesting that formula or other dietary sources may contribute more lead to infant diets than breast milk does. In that study, an interquartile range increase in breast milk lead ( $\sim 2$  ppb) increased infant blood lead by 25%, or approximately 1  $\mu\text{g}/\text{dL}$ .

There are published reports of lead entering formula through lead in tap water used to prepare infant formula (Shannon and Graef 1989) or the use of leaded storage containers (Shannon 1998). For instance, in a convenience sample of home-prepared reconstituted infant formula collected in a pediatrics department in metropolitan Boston, two of forty samples were found to have lead concentrations above 15  $\mu\text{g}/\text{L}$  (Baum and Shannon 1997), which is the EPA lead action level for water. It is recommended that infant formula requiring reconstitution be made only with bottled or filtered tap water, or with cold water after flushing the tap for at least 3 minutes before use. Water authorities, in conjunction with state and local public health authorities, should consider issuing recommendations for the use of tap water in preparing infant formula based on lead levels in local tap water.

**Table 9-1. Frequency of Maternal Blood Lead Follow-up Testing During Lactation<sup>a</sup> to Assess Risk for Infant Lead Exposure<sup>b</sup> from Maternal Breast Milk**

Initial <sup>c</sup> Venous <sup>d</sup> Blood Lead Level (BLL; µg/dL)	Perform follow-up blood lead test(s)
5-19	Every 3 months, per guidelines for adult blood lead testing (Appendix VI), unless infant blood lead levels are rising or fail to decline. <sup>e</sup>
20-39	2 weeks postpartum and then at 1- to 3-month intervals depending on direction/magnitude of trend in infant BLLs.
≥40	Within 24 hours postpartum and then at frequent intervals depending on clinical interventions and trend in BLLs.  Consultation with a clinician experienced in the management of lead poisoning is advised.

<sup>a</sup>If a woman becomes pregnant while lactating, she should be followed according to the schedule for pregnancy [see Table 5-3].

<sup>b</sup>Need to coordinate care between mother and infant in the postpartum period.

<sup>c</sup>Last blood lead level measured in pregnancy or at delivery (maternal or cord BLL).

<sup>d</sup>Venous blood sample is recommended for maternal blood lead testing.

<sup>e</sup>Infant should be monitored according to schedules in Tables 5-1 and 5-2.

**Table 9-2. Estimated Daily Intake of Lead from Breast Milk at Different Maternal Blood Lead Concentrations**

Maternal Blood Lead Concentration, µg/dL	Maternal Plasma Lead Concentration, µg/dL <sup>a</sup>	Breast Milk Lead Concentration, µg/L <sup>b</sup>	Infant Lead Intake from Breast Milk at Age 9 Months, µg/day <sup>c</sup>	Infant Lead Intake from Breast Milk at Age 12 Months, µg/day <sup>d</sup>
1	0.03	0.3	0.3	0.27
2	0.06	0.6	0.6	0.54
3	0.09	0.9	0.9	0.81
4	0.12	1.2	1.2	1.1
5	0.15	1.5	1.5	1.4
8	0.24	2.4	2.4	2.2
10	0.3	3	3	2.7
20	0.6	6	6	5.4
30	0.9	9	9	8.1
40	1.2	12	12	11.0

<sup>a</sup>Calculated as 3% of maternal blood lead concentration.

<sup>b</sup>Numerically equal to maternal plasma lead concentration, but expressed per liter rather than per deciliter.

<sup>c</sup>Assuming the upper ingestion limit of 1,000 mL milk per day at these ages (U.S. Environmental Protection Agency 1997).

<sup>d</sup>Assuming the upper ingestion limit of 900 mL milk per day at this age (U.S. Environmental Protection Agency 1997).

**Table 9-3. Estimated<sup>a</sup> Increase in Infant Blood Lead Concentration<sup>b</sup> Associated with Different Maternal Blood Lead Concentrations at 1 Month Postpartum**

Maternal Blood Lead Concentration, µg/dL	Estimated Breast Milk Lead Concentration, µg/L <sup>c</sup>	Estimated Associated Increase in Infant Blood Lead at Age 1 Month, µg/dL <sup>d</sup>
1	0.3	0.12
2	0.6	0.25
3	0.9	0.37
4	1.2	0.49
5	1.5	0.62
8	2.4	0.98
10	3	1.2
20	6	2.5
30	9	3.7
40 <sup>e</sup>	12	4.9

<sup>a</sup>This estimation integrates absorption, distribution, and excretion.

<sup>b</sup>These values are estimations based ICP-MS laboratory analysis and increments of less than 2 µg/dL would not necessarily be detectable in clinical laboratories.

<sup>c</sup>See Table 9-2.

<sup>d</sup>Calculated based on the observation that a 2 µg/L increase in breast milk lead is associated with an increase of 0.82 µg/dL in the blood lead of the nursing infant (Ettinger et al. 2004b).

<sup>e</sup>Extrapolation beyond the range of observed data from Ettinger et al. 2004b (where maternal BLLs ranged from 1-30 µg/dL).

### INTRODUCTION

The clinical and public health recommendations presented throughout these guidelines are based on current research findings where available; however, research has not been published to provide definitive guidance on all issues of interest. On other topics, the research base is clear, but existing policy is not consistent with research findings. For some topics, existing training and continuing education mechanisms are not working to deliver key findings to health professionals in critical fields, like obstetrics, pediatrics, family practice, and nursing. Together, these gaps in research, policy, and health education create an infrastructure that fails to reinforce optimal clinical and public health practice. This chapter presents specific research, policy, and health education needs identified by CDC to improve current service delivery and to inform development of future practice guidelines and policy with respect to lead exposure above background levels in pregnancy and lactation.

### RESEARCH NEEDS

#### Biomedical Research

##### ***Long-term prospective studies of the effect of lead exposure during fetal development and disease risks later in life***

Given the immaturity of the blood-brain barrier in the developing nervous system, children might be more susceptible to morphologic changes in the nervous system during the prenatal and early postnatal periods. Further research is needed on

- Lead kinetics across the placenta and in breast milk, and their relationship to development and disease risk across the lifespan for children exposed to lead *in utero* or as nurslings.
- Specific health outcomes of interest, other than neurodevelopmental effects, such as pregnancy outcome and cardiovascular disease in adulthood following *in utero* exposure.

##### ***Follow-up studies of pregnancy outcomes and infant development in women with a history of lead exposure above background levels during pregnancy***

Research is needed to better characterize health outcomes for mothers and infants associated with maternal lead exposure during pregnancy—at low elevations of blood lead typical for the U.S. population of women of childbearing age, as well as in more heavily exposed subgroups. Research is needed on

- Specific health outcomes of interest, including pregnancy-related hypertension, low birth weight, and preterm birth.
- Possible association between maternal lead exposure and spontaneous abortion, particularly at BLLs <30 µg/dL.
- Epidemiology of lead exposure during pregnancy and health outcomes.
- Experimental investigation of the biological mechanisms.

##### ***Genetic susceptibility to adverse effects of lead exposure (gene-environment interactions)***

Some studies have suggested that specific genes may render certain individuals more vulnerable to the adverse effects of lead exposure. Research is needed to

- Characterize whether and how the bioaccumulation and toxicokinetics of lead are associated with genetic variation, such as ALDA phenotype or the HFE gene variants.
- Investigate other potential gene-environment interactions.

### ***Value of maternal biomarkers to predict later infant and childhood blood lead levels***

While research has shown that maternal blood lead level is closely associated with infant/cord blood lead level at birth, the kinetics of lead in the newborn exposed *in utero* are not well understood. In addition, it is not clear whether tissue stores built up during gestation may be a significant source of lead as children age. Studies are needed to determine whether maternal biomarkers (maternal or umbilical blood lead levels) are useful to predict postnatal blood lead levels throughout infancy and childhood.

### ***Biokinetics of lead in breastmilk***

More information is needed on the biokinetics and cumulative dose of lead to the breastfeeding infant at various maternal blood lead levels. Research is needed to determine how breast milk lead levels change over the course of lactation, and whether there are factors in breast milk or maternal diet that would enhance or retard the absorption of lead from breast milk by the infant.

### ***Biokinetics of lead with nutritional supplementation or super-supplementation during pregnancy***

- Large randomized clinical trials are needed to determine if nutritional supplements, diet modification, or a combination of diet and supplements may be a means of secondary prevention of exposure to lead during pregnancy.
- Research is needed to determine whether the impact of nutritional factors differs for women prepregnancy, during pregnancy, or during lactation, or depending on the woman's lead burden or prior chelation therapy. Extrapolation from animal studies may be necessary.

### ***Pharmacokinetics and effectiveness of chelating agents during pregnancy and lactation***

Minimal clinical data are available to inform decisions regarding the use of chelating agents in pregnant women, such as data on toxicity, treatment regimen, and timing of treatment. Studies are needed on

- The effects of prenatal chelation on mothers and infants and on lead kinetics across the placenta; however, since this type of research is often not possible in humans due to ethical concerns about research on human subjects, extrapolation from animal studies may be necessary.
- The effectiveness of chelation therapy on mitigation of adverse health outcomes other than neurodevelopment.

### ***Use of educational and developmental support and intellectual stimulation to improve academic/life performance of children exposed to lead *in utero****

Current research shows that lead exposure is associated with lifelong health and developmental effects in humans; however, questions have been raised from animal studies and clinical experience about whether and the extent to which certain cognitive effects can be mitigated by educational interventions during childhood. Long-term follow-up studies of children exposed to lead *in utero* are needed to evaluate whether specific educational or developmental interventions can improve cognitive outcomes. To be useful, such studies must carefully control for factors that may confound the relationship between educational strategies and cognitive outcomes.

***Identification and development of new therapeutic agents or mechanisms to remove lead from breast milk and bone or tissue storage sites in women of childbearing age.***

Since bone lead stores persist for decades, women and their infants may be at risk for exposure long after environmental sources have been abated. At present, no interventions are available to remove lead from breast milk or from bone or tissue storage sites in women of childbearing age. Identification and development of pre-pregnancy interventions that decrease bone lead stores, or render them less mobilizable, may prove beneficial.

**Health Services Research**

***Develop estimates for the number and distribution of pregnant women in the United States who should have blood lead tests, and the costs and benefits associated with testing and follow-up care***

Limited data are available on the numbers of pregnant women who meet the criteria for blood lead testing recommended in these guidelines. Research is needed to

- Estimate the number of pregnant women in the US who should be tested for lead exposure, the costs for such testing, and the costs for recommended follow-up care. This research should include an assessment of the ability of high-risk women to access blood lead testing and follow-up services, including environmental intervention, as well as determine who bears the burden of these costs.
- Estimate the societal benefits expected to be derived from testing and treating pregnant women for lead exposure as recommended herein.

***Develop guidance for validation of risk questionnaires for pregnant women in specific clinical settings and subpopulations***

Only a few communities have developed risk questionnaires to inform decisions about blood lead testing of pregnant women; however, these guidelines recommends their use. Practical methods for adapting and validating risk questionnaires at the local level should be developed and disseminated by CDC and state and local health departments. Such guidance would allow local health agencies and health care providers to develop reliable risk questionnaires that are responsive to local conditions.

***Optimal timing for blood lead testing during pregnancy***

Identification of lead-exposed pregnant women potentially offers the most benefit to women and their infants; however, there are no studies that identify when in pregnancy blood lead testing should be done. Given the curvilinear trajectory of blood lead levels over the course of pregnancy, blood lead testing done in different trimesters may either over- or underestimate the woman's true lead exposure.

***Characterize risk factors for pica and clinical strategies to identify pica in pregnant and lactating women***

While pica behavior is relatively uncommon in the general population, pica is observed in some populations of pregnant women in the United States, particularly those who have recently immigrated. Research is needed on how clinicians can more effectively identify pica, particularly those factors (age, race, country of origin, nutritional or health status, etc.) that may predispose a woman to pica.

***Effectiveness of interventions to reduce pica among pregnant women***

Only a few studies are available that evaluate the effectiveness of interventions designed to reduce or eliminate pica behavior; none of these include pregnant women. Studies are needed on the effectiveness of

behavior modification strategies for specific types of pica. Given the frequency of pica among some immigrant populations, culturally specific interventions should be a priority for investigation.

## **HEALTH POLICY NEEDS**

### **Stronger Occupational Standards for Lead Exposure, Especially for Pregnant Women**

Current OSHA policy requires medical evaluations at blood lead levels of 40 µg/dL, and removal from the workplace when blood lead levels exceed 50 µg/dL (for construction) or 60 µg/dL (for general industry). Some industries where workers may be exposed to high levels of lead are not protected by OSHA. Current occupational standards were developed over 30 years ago and have not been updated to reflect research findings that lead exposure during pregnancy is associated with adverse effects on fetal growth and neurodevelopment, maternal health, and an increased risk for spontaneous abortion. Updated standards consistent with the current knowledge about the health effects of lead exposure are needed to provide clear guidance to industry, policy makers, and workers, as well as because medical judgments may be influenced by existing regulations.

- The Occupational Safety and Health Administration Standard for lead exposure should be updated to require that occupationally exposed women who are pregnant be removed from lead exposure if their blood lead level is 10 µg/dL or higher.
- If the blood lead level is in the range of 5 to 9 µg/dL, efforts should be made to identify and reduce lead exposure on the job and review appropriate use of personal protective equipment.
- All lead-exposed workers who have the potential to be exposed by lead ingestion, even in the absence of documented elevations in air lead levels, should be under medical surveillance.
- Lead exposure should be regulated in categories of workers currently not covered by the OSHA standard.

### **Regulation of Alternative Medicines and Dietary Supplements to Ensure Product Safety and Accuracy in Labeling and Marketing**

National policy is needed to establish regulatory mechanisms to control the safety and quality of alternative medicines and dietary supplements sold commercially in the United States.

- Health claims for alternative medicines and dietary supplements should meet the same rigorous criteria as claims by drugs used to prevent or treat disease.
- Regulatory standards for the content, labeling, and marketing of such products should be established and enforced.
- The Federal Trade Commission, in cooperation with FDA, should ensure that advertising for dietary supplements is accurate and not misleading.

### **Regulatory Authority to Require Lead Safety in Dwellings Occupied by Pregnant Women and Resources to Control Lead Hazards in These Units**

State and local health or housing agencies should have the statutory authority to require and enforce lead paint hazard abatement in rental housing where pregnant women reside, to allow parents to bring their babies home to safe housing. Such statutes should also have provisions to protect pregnant tenants from retaliatory eviction by property owners unwilling to comply. Jurisdictions should also have public resources available to control lead hazards in those units where private resources are unattainable. [See Chapter 11 for information on lead safety resources.]

### **Mandatory Reporting of All Adult Blood Lead Levels**

Public health agencies need to be informed of blood lead testing results on adults in order to identify and investigate new community exposure sources, monitor epidemiological trends, and assure appropriate interventions for identified cases, including environmental inspection and case management services. Laboratories should be required to report all blood lead level test results on adults to the health department, preferably in standard electronic form. Such reporting could enable health departments to identify pregnant women with lead exposure above background levels for priority interventions.

### **Reimbursement for Blood Lead Testing and Follow-Up Care for Uninsured Pregnant and Lactating Women and Their Infants**

Blood lead testing and follow up services (including case management, nutritional interventions, chelation therapy, and environmental investigation) are essential to appropriate medical management of pregnant and lactating women with lead exposure above background levels. However, a lack of insurance can be prohibitive to proper care for many women. In addition, such services may not be covered by insurance for documented immigrants during their first 5 years of residence in the United States or at all for undocumented immigrants. The State Children's Health Insurance Program allows the use of federal funds for prenatal services to women regardless of immigration status in order to ensure the health of the fetus. States should use these funds for services necessary to reduce or treat lead exposure above background levels during the woman's pregnancy and lactation.

### **Sharing of Clinical Data Via Electronic Health Records**

Proper medical management of pregnant or lactating women with lead exposure above background levels and their infants requires that the medical records of both mother and child contain relevant data related to lead. For example, the infant's chart should contain information about the mother's blood lead level at birth and about identified environmental sources. Likewise, the mother's chart should contain information about the infant's blood lead level. However, such records are likely to be maintained by different health care providers and complicated by differing records systems, the possibility of different maternal/child surnames, etc. The adoption of electronic medical records would permit an automated linkage of the two charts to ensure that appropriate data can be transmitted to the other chart.

## **HEALTH EDUCATION NEEDS**

### **Continuing Medical Education on Lead and Pregnancy**

Continuing Medical Education (CME) training on lead and pregnancy is needed to familiarize health care providers with this current research base and clinical recommendations. CDC, in consultation and cooperation with medical specialty associations (e.g., ACOG, AAP, American Academy of Family Physicians), nursing associations (e.g., American Nurses' Association, American College of Nurse-Midwives), and environmental health associations should develop a training course module on lead and pregnancy or alternatively incorporate a discussion of lead exposure and pregnancy into preexisting educational materials, such as the Agency for Toxic Substances and Disease Registry's *Case Studies in Environmental Medicine*, which can be taken for continuing education credit. The training should include information on evaluating risk factors for lead exposure as part of an occupational, environmental, and lifestyle health risk assessment.

### **Environmental Health Requirement in Basic Practitioner's Curriculum**

Pediatric medical and nursing education currently lacks sufficient environmental health content necessary to prepare pediatric health care professionals to prevent, recognize, manage, and treat environmental exposure related disease including lead exposure during pregnancy. Thus, educational opportunities for physicians, nurses, environmental engineers, and other practitioners during their training are needed. Such courses should also incorporate material on cultural competency and health literacy. The Pediatric Environ-

mental Health Specialty Units (PEHSUs) and CDC's provider education series are appropriate vehicles for these courses. CDC and the PEHSUs should coordinate publications and educational offerings with ACOG, AAP, the American Academy of Family Physicians, and the American College of Nurse Midwives.

### **Preconceptional Counseling on Lead Exposure for Adults of Childbearing Age**

Primary and reproductive health care providers should provide counseling to patients of childbearing age about the effects of lead on fertility, pregnancy, and infant outcomes. They should educate their patients about possible lead exposure sources and how to reduce exposure in advance of conception. Such counseling should include referrals to appropriate sources for further assistance in assessing and reducing environmental or occupational lead exposures. CDC should collaborate with the national professional health organizations, such as the American College of Obstetricians and Gynecologists, American Medical Association, and The American Academy of Family Physicians, and nonprofit organizations, such as the March of Dimes, to develop and disseminate educational materials to convey these messages.

### **Expand Resources for National Centralized Data Collection and Management Facility**

A comprehensive online system is needed to improve dissemination of data on various sources of lead to medical and public health providers and the community. Such a system would provide real-time product identification information to alert providers and the communities at risk for exposure. It would also allow agencies that are testing products (e.g., CPSC, FDA, State of California) to enter information on tainted products into one easily accessible database.

### **Evaluate the Effectiveness of Currently Available Personal Protective Equipment**

The capacity of available personal protective equipment to keep BLLs below 5 µg/dL is an area of needed research. Such studies should also inform the creation of more sophisticated equipment that can ensure that BLLs of workers remain below 5 µg/dL.

## CHAPTER 11. RESOURCES AND REFERRAL INFORMATION

Contact information is provided here for key information sources for topics covered in this report. While not an exhaustive list, these resources provide a useful starting point for readers interested in updates, publications, referrals, or additional information.

## Appendices

**Appendix I**  
Existing State Legislation Related to Lead and Pregnant Women

## Existing State Legislation Related to Lead and Pregnant Women

### **SCREENING LAW(S):**

#### New York Public Health Law §1370-a(2)

Summary: Requires dept to promulgate and enforce regulations for screening children and **pregnant women** for lead poisoning, and for follow-up treatment for those with positive results.

#### New York Public Health Law §1370-c

Summary: Authorizes dept to establish screening intervals and methods, which shall be followed by every physician or other provider of medical care to children or **pregnant women**.

#### Connecticut Gen. Stat. §19a-111

The commissioner shall establish, in conjunction with recognized professional medical groups, guidelines consistent with the CDC for assessment of the risk of lead poisoning, screening for lead poisoning and treatment and follow-up care of individuals including children with lead poisoning, women who are **pregnant** and women who are planning **pregnancy**.

### **RISK REDUCTION LAW(S):**

#### Maryland Code §6-801- 6-852; Article 48A §734-737; Real Property § 8-208.2

Comply with specific Risk Reduction standards when notified of certain conditions such as chipping paint or the presence in the unit of a child or **pregnant woman** with an elevated blood lead level of 15 µg/dl or higher.

#### Minnesota Statute §144.9504

Lead risk assessment. (a) An assessing agency shall conduct a lead risk assessment of a residence according to the venous blood lead level and time frame set forth in clauses (1) to (4) for purposes of secondary prevention: within ten working days of a **pregnant female** in the residence being identified to the agency as having a venous blood lead level equal to or greater than ten micrograms of lead per deciliter of whole blood.

Subd. 5. Lead orders. (a) An assessing agency, after conducting a lead risk assessment, shall order a property owner to perform lead hazard reduction on all lead sources that exceed a standard adopted according to section 144.9508.

### **EDUCATION LAW(S):**

#### Michigan Comp. Laws §333.5473a(2-3)

Summary: Requires department to establish and conduct educational programs to educate homeowners and remodelers of lead-safe practices and methods of lead-hazard reduction activities; (4): requires department to recommend appropriate maintenance practices for owners of residential property and day care facilities designed to prevent lead poisoning in children 6 years or younger and **pregnant women**.

### **PROPOSED LEGISLATION (NOT ENACTED):**

California – Requires the Department to make available to all health care providers that administer **perinatal care** services informational materials on lead and require providers to make this information available to **pregnant women**.

New York – Bill aimed at eliminating lead hazards in housing which is or will be occupied by **pregnant women** or children 7 years of age or less.

Ohio - Requires the Director to produce an educational audio-video recording on lead poisoning prevention for at-risk **pregnant women**.

**Appendix II**  
Charge Questions to the Lead and Pregnancy Work Group

## **Charge Questions to the Lead and Pregnancy Work Group**

### **Subgroup 1. Prevalence, Risk and Screening**

This group was asked to review literature including but not limited to:

- Distribution of BLLs and other measures of lead body burden in:
  - women of childbearing-age
  - pregnant women at various gestational ages
  - lactating women
  - newborns
- Risk factors/sources for elevated blood lead levels in pregnant and lactating women and the newborns
- Relationship between:
  - maternal blood/bone lead levels and newborn blood lead levels
  - pregnancy BLLs and postpartum BLLs?

Based on subgroup findings, address the following questions:

- When should pregnant women be screened for lead poisoning and when should screening occur? Are there questions that can predict which woman should be screened?
- What culturally sensitive interventions should be recommended to reduce exposure to potential sources?

### **Subgroup 2. Maternal, Pregnancy and Child Outcomes**

This group was asked to review literature including but not limited to:

- Impact of elevated blood lead levels on:
  - fertility (spontaneous abortion, stillbirth)
  - maternal health (pregnancy induced hypertension)
  - pregnancy outcomes (preterm delivery, gestational age, birth weight, birth length, head circumference)
  - neurodevelopment outcomes due to prenatal exposure
  - behavioral outcomes due to prenatal exposure

Based on subgroup findings, address the following questions:

- When blood lead levels are elevated, what guidance should medical providers be providing to:
  - women of child-bearing age regarding delaying of pregnancy?
  - pregnant women about potential outcomes?

### **Subgroup 3. Management, Treatment and Other Interventions**

This group was asked to review literature including but not limited to:

- Breast milk exposure including:
  - Amount transmitted to baby
  - Benefits vs. hazards of breast feeding when blood lead levels are elevated
- Effectiveness of nutritional supplementation during pregnancy and lactation
- Indications/Contraindications/Adverse effects of chelation on:
  - pregnant woman, fetus, and newborns

Based on subgroup findings, address the following questions:

- What is the follow-up testing schedule at various blood lead levels for pregnant and lactating women and for the newborns?
- At what blood lead level, if any, should women be advised against breastfeeding?
- What nutrition counseling or nutritional supplements should be recommended?
- What chelating agents should be employed?
- What interventions should be provided by public health agencies at various blood lead levels?

**Appendix III**  
Commonly Ingested Substances in Pregnancy-related Pica, Reasons for Use,  
and Country/Race-Ethnicity or Origin

**Commonly-ingested Substances in Pregnancy-related Pica, Reasons for Use, and Country/ Race-Ethnicity of Origin**

<b>Substance/ Name</b>	<b>Reason Used (If known or reported)</b>	<b>Country</b>	<b>Race/ Ethnicity or Regional Affiliation</b>
Bean Stones		<b>Mexico</b>	
Clay		<b>Asia</b> India	Hindu
Clay		<b>Caribbean</b> Trinidad Jamaica	Hindu
Clay		<b>Africa:</b> Uganda, Kenya, Zambia Ghana South Africa	
Clay		<b>Middle East</b> Saudi Arabia	
Clay (Cipula, Kipula, Akipula, Askipula)		<b>Central America</b> Belize	
Clay, Clay Pottery (Tierra Santa, Benditos)		<b>Mexico</b>	
Clay		<b>North America</b> US	African-Americans (South, particularly rural areas) Immigrants
Corn Starch	Nausea/GI upset	US	African-Americans (South)
Dirt or soil		<b>Mexico</b>	
Ice/ Refrigerator Frost	Relieve thirst, cool down	<b>North America</b> US  Mexico	African-Americans (South)
Milk of Magnesia (Solid)		<b>Mexico</b>	

**Appendix IV**  
List of Occupations and Hobbies That Involve Lead Exposure

## **List of Occupations and Hobbies that Involve Lead Exposure**

### **Lead Related Occupations and Industries**

Ammunition/explosives production  
Automotive repair shops  
Battery manufacturing and recycling  
Brass, bronze, copper or lead foundries  
Bridge, tunnel and elevated highway/subway construction  
Cable/wire stripping, splicing or production  
Ceramic manufacturing  
Firing range work  
Glass recycling, stained glass and glass manufacturing  
Home renovation/restoration  
Lead Abatement  
Lead production or smelting  
Machining or grinding lead alloys  
Manufacturing and installation of plumbing components  
Manufacturing of industrial machinery and equipment  
Metal scrap yards and other recycling operations  
Motor vehicle parts and accessories  
Occupations using firearms  
Plastics manufacturing  
Pottery making  
Production and use of chemical preparations  
Rubber manufacturing  
Sandblasting, sanding, scraping, burning or disturbing lead paint  
Use of lead based paints  
Welding or torch-cutting painted metal

### **Hobbies and Activities That May Cause Lead Exposure**

Making stained glass and painting on stained glass  
Copper Enameling  
Bronze Casting  
Making pottery and ceramic ware with lead glazes and paints  
Casting ammunition, fishing weights or lead figurines  
Collecting, painting or playing games with lead figurines  
Jewelry making with lead solder  
Electronics with lead solder  
Furniture refinishing  
Glassblowing with leaded glass  
Print making and other fine arts  
Liquor distillation  
Hunting and target shooting  
Remodeling/renovating homes built before 1978

**Appendix V**  
Alternative Cosmetics, Food Additives, and Medicines That Contain Lead

## Alternative Cosmetics, Food Additives, and Medicines that Contain Lead

Exposure Source	Description/ Exposure Pathway
<i>Albayalde</i> or <i>albayaidle</i>	Used by mainly by Mexicans and Central Americans to treat vomiting, colic, apathy and lethargy.
<i>Al Kohl</i> (Middle East, India, Pakistan, some parts of Africa)	A gray or black eye cosmetic applied to the conjunctival margins of the eyes for medicinal and cosmetic reasons. Can contain up to 83% lead. It is believed to strengthen and protect the eyes against disease and may be used as an umbilical stump remedy. Also known as simply as <b>kohl</b> .
<i>Al Murrah</i>	Used as a remedy for colic, stomach aches and diarrhea in Saudi Arabia.
<i>Anzroot</i>	A remedy from the Middle East used to treat gastroenteritis.
<i>Azarcon</i>	Also known as <b>alarcon</b> , <b>coral</b> , <b>luiga</b> , <b>maria luisa</b> , or <b>rueda</b> . Bright orange powder used to treat “empacho” (an illness believed to be caused by something stuck in the gastrointestinal tract, resulting in diarrhea and vomiting). Azarcon is 95% lead.
Ayurvedic medicine (Tibet)	Traditional medicines that may contain lead. Some examples include: <b>guglu</b> , <b>sundari kalp</b> , <b>jambrulin</b>
<i>Ba-Baw-San</i> or <i>Ba-Bow-Sen</i> (China)	Herbal medicine used to detoxify “fetal poisoning” and treat colic pain or to pacify young children.
<i>Bali goli</i>	A round, flat black bean which is dissolved in “gripe water” and used within Asian Indian cultures for stomach ache.
<i>Bint Al Zahab</i> (Iran)	Rock ground into a powder and mixed with honey and butter given to newborn babies for colic and early passage of meconium after birth.
<i>Bint Dahab</i> (Saudi Arabia; means “daughter of gold”)	A yellow lead oxide used by local jewelers and as a home remedy for diarrhea, colic, constipation and general neonatal uses.
<i>Bokhoor</i> (Kuwait)	A traditional practice of burning wood and lead sulfide to produce pleasant fumes to calm infants.
<i>Cebagin</i>	Used in the Middle East as a teething powder.
<i>Chufong tokuwan</i>	A pill imported from Hong Kong used to treat a wide variety of ailments.
<i>Cordyceps</i>	Used in China as a treatment for hypertension, diabetes and bleeding.
<i>Deshi Dewa</i>	A fertility pill used in Asia and India.
<i>Farouk</i>	A teething powder from Saudi Arabia.
<i>Ghasard</i>	Brown powder used in Asian Indian cultures as a tonic to aid in digestion.
<i>Greta</i> (Mexico)	Yellow powder used to treat “empacho” (see <b>azarcon</b> ); can be obtained through pottery suppliers, as it is also used as a glaze for low-fired ceramics. Greta is 97% lead.
<i>Hai Ge Fen</i> (Concha cyclinae sinensis)	A Chinese herbal remedy derived from crushed clam shells.
<i>Henna</i>	Used as a hair dye and for temporary tattoos in the Middle East and India - may contain lead.

<i>Jin Bu Huan (China)</i>	An herbal medicine used to relieve pain.
<i>Kandu</i>	A red powder from Asia and India used to treat stomach ache.
<i>Koo Sar</i>	Red pills from China used to treat menstrual cramps.
<i>Kushta</i>	Used for diseases of the heart, brain, liver, and stomach and as an aphrodisiac and tonic in India and Pakistan.
<i>Litargirio</i>	A yellow or peach-colored powder used as a deodorant, a foot fungicide and a treatment for burns and wound healing particularly by people from the Dominican Republic.
<i>Lozeena</i>	An orange powder used to color rice and meat that contains 7.8% - 8.9% lead.
<i>Pay-loo-ah (Vietnam)</i>	A red powder given to children to cure fever or rash.
<i>Po Ying Tan (China)</i>	An herbal medicine used to treat minor ailments in children.
<i>Santrinj (Saudi Arabia)</i>	An amorphous red powder containing 98% lead oxide used principally as a primer for paint for metallic surfaces, but also as a home remedy for "gum boils" and "teething."
<i>Surma (India)</i>	Black powder used as an eye cosmetic and as teething powder or umbilical stump remedy.
<i>Tibetan herbal vitamin</i>	Used to strengthen the brain.
<i>Traditional Saudi medicine</i>	Orange powder prescribed by a traditional medicine practitioner for teething; also has an antidiarrheal effect.

Research conducted in recent years has increased public health concern about the toxicity of lead at low dose and has supported a reappraisal of the levels of lead exposure that may be safely tolerated in the workplace. In this article, which appears as part of a mini-monograph on adult lead exposure, we summarize a body of published literature that establishes the potential for hypertension, effects on renal function, cognitive dysfunction, and adverse female reproductive outcome in adults with whole-blood lead concentrations < 40 µg/dL. Based on this literature, and our collective experience in evaluating lead-exposed adults, we recommend that individuals be removed from occupational lead exposure if a single blood lead concentration exceeds 30 µg/dL or if two successive blood lead concentrations measured over a 4-week interval are ≥ 20 µg/dL. Removal of individuals from lead exposure should be considered to avoid long-term risk to health if exposure control measures over an extended period do not decrease blood lead concentrations to < 10 µg/dL or if selected medical conditions exist that would increase the risk of continued exposure. Recommended medical surveillance for all lead-exposed workers should include quarterly blood lead measurements for individuals with blood lead concentrations between 10 and 19 µg/dL, and semiannual blood lead measurements when sustained blood lead concentrations are < 10 µg/dL. It is advisable for pregnant women to avoid occupational or avocational lead exposure that would result in blood lead concentrations > 5 µg/dL. Chelation may have an adjunctive role in the medical management of highly exposed adults with symptomatic lead intoxication but is not recommended for asymptomatic individuals with low blood lead concentrations. **Key words:** adult lead exposure, blood lead, chelation, medical management, medical surveillance, pregnancy. *Environ Health Perspect* 115:463–471 (2007). doi:10.1289/ehp.9784 available via <http://dx.doi.org/> [Online 22 December 2006]

As a likely consequence of its capacity to interfere with biochemical events present in cells throughout the body, inorganic lead exerts a wide spectrum of multisystemic adverse effects. These health impacts range from subtle, subclinical changes in function to symptomatic, life-threatening intoxication. In recent years, research conducted on lead-exposed adults has increased public health concern over the toxicity of lead at low dose. These findings support a reappraisal of the levels of lead exposure, sustained for either short or extended periods of time, that may be safely tolerated in the workplace. In this article we offer health-based recommendations on the management of lead-exposed adults aimed at primary and secondary prevention of lead-associated health problems. As noted in the introduction to this mini-monograph (Schwartz and Hu 2007) the authors of this article are an independent subgroup of an expert panel (8 of 13 members) originally convened by the Association of Occupational and Environmental Clinics ([www.aocc.org](http://www.aocc.org)) to address these management

issues. In deriving the recommendations in this article, we took note of a body of literature that establishes the potential for adverse health effects at blood lead concentrations or exposure levels permissible under current workplace regulations established in the 1970s by the U.S. Occupational Safety and Health Administration (OSHA). These regulations generally require removal from lead exposure when whole-blood lead concentrations exceed 50 or 60 µg/dL. These values are considerably above blood lead concentrations of the general population of the United States, which had a geometric mean of 12.8 µg/dL in the late 1970s (National Center for Health Statistics 1984), and a recent value of 1.45 µg/dL [U.S. Centers for Disease Control and Prevention (CDC) 2005].

In setting forth our perspective on the recommended medical management of adult lead exposure, the narrative of this article focuses on four categories of health effects—hypertension, decrement in renal function, cognitive dysfunction, and adverse reproductive

outcome—that have been the subject of much recent research. The discussion of these end points highlights those studies, that by virtue of their design and scope, were particularly influential in establishing the authors' concerns regarding the potential for adverse health effects at low to moderate levels of lead exposure in adults. Collectively, these effects support the preventive medical management strategies that are recommended in the tables. A review of the extensive literature on the health effects of lead is beyond the scope of this article, but the reader is referred to reviews on the cardiovascular and cognitive impacts of lead on adults that appear elsewhere in this mini-monograph (Navas-Acien et al. 2007; Shih et al. 2007), as well as a review on recent lead literature prepared by the U.S. Environmental Protection Agency (EPA) for its Air Quality Criteria for Lead (U.S. EPA 2006).

Table 1 is a summary of the adverse health risks associated with different blood lead concentrations and presents corresponding medical management recommendations that range from discussion of risks and

reduction of lead exposure at low levels to removal from lead exposure accompanied by probable chelation therapy at the highest levels. The designation of risks as either "short-term" or "long-term," depending on whether the risks are associated with exposure lasting less than or more than 1 year, reflects a qualitative understanding of the duration of lead exposure that may be required to elicit certain adverse health effects of lead. For some of the long-term risks, such as hypertension, research employing noninvasive K-shell X-ray fluorescence measurement of lead in bone, a biomarker of long-term cumulative exposure, suggests that several years of sustained elevations in blood lead may be necessary for a

significant risk to emerge. The use of 1 year as a cut-point in the table is not intended to represent a sharp division, in terms of cumulative dose, between what might constitute a short-term versus a long-term risk nor does it imply that a significant long-term risk begins to exist as soon as 1 year is surpassed. Blood lead, a measure of the amount of lead circulating in the tissues, reflects both recent exogenous exposure as well as endogenous redistribution of lead stored in bone.

The categorization of risks in Table 1 by discrete intervals of blood lead concentration is a qualitative assessment. In clinical practice, substantial interindividual variability in the susceptibility to symptomatic adverse effects

of lead is commonly observed. Factors that might influence the risk of lead toxicity in adults include preexisting disease affecting relevant target organs (e.g., hypertension, renal disease, or neurologic dysfunction), nutritional deficiencies that modify the absorption or distribution of lead (e.g., low dietary calcium or iron deficiency), advanced age, and genetic susceptibility. Although recent studies suggest that polymorphisms in specific genes may modify the toxicokinetics and renal effects of lead (Theppeang et al. 2004; Weaver et al. 2006; Wu et al. 2003), research findings at present are insufficient to conclusively identify genotypes that confer increased risk.

**Table 1.** Health-based management recommendations for lead-exposed adults.

Blood lead level (µg/dL)	Short-term risks (lead exposure < 1 year)	Long-term risks (lead exposure ≥ 1 year)	Management
< 5	None documented	None documented	None indicated
5–9	Possible spontaneous abortion Possible postnatal developmental delay	Possible spontaneous abortion Possible postnatal developmental delay Possible hypertension and kidney dysfunction	Discuss health risks Reduce lead exposure for women who are or may become pregnant
10–19	Possible spontaneous abortion Possible postnatal developmental delay Reduced birth weight	Possible spontaneous abortion Reduced birth weight Possible postnatal developmental delay Hypertension and kidney dysfunction Possible subclinical neurocognitive deficits	As above for BLL 5–9 µg/dL, plus: Decrease lead exposure Increase biological monitoring Consider removal from lead exposure to avoid long-term risks if exposure control over an extended period does not decrease BLL < 10 µg/dL, or if medical condition present that increases risk with continued exposure <sup>a</sup>
20–29	Possible spontaneous abortion Possible postnatal developmental delay Reduced birth weight	Possible spontaneous abortion Possible postnatal developmental delay Reduced birth weight Hypertension and kidney dysfunction Possible subclinical neurocognitive deficits	Remove from lead exposure if repeat BLL measured in 4 weeks remains ≥ 20 µg/dL
30–39	Spontaneous abortion Possible postnatal developmental delay Reduced birth weight	Spontaneous abortion Reduced birth weight Possible postnatal developmental delay Hypertension and kidney dysfunction Possible neurocognitive deficits Possible nonspecific symptoms <sup>b</sup>	Remove from lead exposure
40–79	Spontaneous abortion Reduced birth weight Possible postnatal developmental delay Nonspecific symptoms <sup>b</sup> Neurocognitive deficits Sperm abnormalities	Spontaneous abortion Reduced birth weight Possible postnatal developmental delay Nonspecific symptoms <sup>b</sup> Hypertension Kidney dysfunction/nephropathy Subclinical peripheral neuropathy Neurocognitive deficits Sperm abnormalities Anemia Colic Possible gout	Remove from lead exposure Refer for prompt medical evaluation Consider chelation therapy for BLL > 50 µg/dL with significant symptoms or signs of lead toxicity
≥ 80	Spontaneous abortion Reduced birth weight Possible postnatal developmental delay Nonspecific symptoms <sup>b</sup> Neurocognitive deficits Encephalopathy Sperm abnormalities Anemia Colic	Spontaneous abortion Reduced birth weight Possible postnatal developmental delay Nonspecific symptoms <sup>b</sup> Hypertension Nephropathy Peripheral neuropathy Neurocognitive deficits Sperm abnormalities Anemia Colic Gout	Remove from lead exposure Refer for immediate/urgent medical evaluation Probable chelation therapy

BLL, blood lead level.

<sup>a</sup>Medical conditions that may increase the risk of continued exposure include chronic renal dysfunction (serum creatinine > 1.5 mg/dL for men and > 1.3 mg/dL for women, or proteinuria), hypertension, neurologic disorders, and cognitive dysfunction. <sup>b</sup>Nonspecific symptoms may include headache, fatigue, sleep disturbance, anorexia, constipation, arthralgia, myalgia, and decreased libido.

## Health Effects at Low Dose

**Hypertension.** Animal investigations support a pressor effect of lead at low dose (Fine et al. 1988; Gonick et al. 1997; Vaziri 2002). Epidemiologic investigations conducted in large general population samples (e.g., Harlan 1988; Nash et al. 2003; Pocock et al. 1988; Schwartz 1988) suggest lead may elevate blood pressure in adults at blood lead concentrations < 20 µg/dL. In some human studies of the link between blood lead and blood pressure, the relationship appeared to be influenced by subjects' sex or race (e.g., Den Hond et al. 2002; Staessen et al. 1996; Vupputuri et al. 2003). Three meta-analyses of studies examining the relationship between blood lead and blood pressure found relatively consistent effects of blood lead on blood pressure. The studies showed statistically significant coefficients for a 2-fold increase in blood lead of 1.0 mmHg (Nawrot et al. 2002; Staessen et al. 1994) or 1.25 mmHg (Schwartz 1995) for systolic blood pressure, and 0.6 mmHg for diastolic blood pressure (Nawrot et al. 2002; Staessen et al. 1994). The study populations analyzed in these meta-analyses included many with blood lead concentrations < 20 µg/dL.

Further support for the impact of low-level lead exposure on blood pressure has emerged from studies employing K-shell X-ray fluorescence measurement of lead in bone, a biomarker of long-term cumulative lead exposure. In two major studies drawn from samples of the general population, bone lead concentration was a significant predictor of the risk of hypertension (Hu et al. 1996; Korrick et al. 1999). Findings from the study by Hu et al. (1996) illustrate the associated risk. In that general population sample of middle-aged to elderly men ( $n = 590$ ), the average blood lead concentration was 6.3 µg/dL. On the basis of the subjects' ages (mean  $67 \pm 7.2$  years), it may be expected that they lived most of their adult lives at a time when the blood lead concentration of the general population ranged from 10 to 25 µg/dL (Hofreuter et al. 1961; Mahaffey et al. 1982; Minot 1938). Comparing the lowest with the highest quintile of bone lead among that cohort, a tibia bone lead increment of 29 µg/g was associated with a 1.5 odds ratio (OR) for hypertension [95% confidence interval (CI), 1.1–1.8]. Given the slope of 0.05 that has described the linear relationship between tibia bone lead concentration and cumulative blood lead index in subjects with chronic lead exposure in many studies (Hu et al. 2007), this increment in bone lead is roughly equivalent to a cumulative blood lead index of 580 µg/dL · years (i.e.,  $29 \div 0.05 = 580$ ). Considered in the context of a 40-year working lifetime, the risk of lead-associated hypertension may be significantly

reduced by preventive measures that lower chronic workplace blood lead concentrations from the 20s and 30s µg/dL range to < 10 µg/dL. For example, a change in average workplace blood lead concentration from 25 to 10 µg/dL over a 40-year working lifetime would reduce a worker's cumulative blood lead index by 600 µg/dL · years, slightly more than the 580 µg/dL · years cited above.

Hypertension is a significant risk factor for cardiovascular and cerebrovascular mortality. As reviewed in an accompanying article in this mini-monograph (Navas-Acien et al. 2007), studies conducted in general population cohorts have consistently observed a positive association between lead exposure and cardiovascular disease. Because of their size and design, studies derived from the National Health and Nutrition Evaluation Surveys (NHANES) are particularly notable. A 16-year longitudinal analysis of the general population cohort studied between 1976 and 1980 as part of NHANES II found that blood lead concentrations of 20–29 µg/dL at baseline were associated with 39% increased mortality from circulatory system disease compared with subjects with blood lead < 10 µg/dL [relative risk (RR) 1.39; 95% CI, 1.01–1.91] (Lustberg and Silbergeld 2002). Two studies recently examined the longitudinal relationship between blood lead concentration and cardiovascular mortality among participants in NHANES III. In a 12-year longitudinal study of participants in NHANES III,  $\geq 40$  years of age ( $n = 9,757$ ), the subgroup with blood lead concentration  $\geq 10$  µg/dL (median, 11.8) had a relative risk of cardiovascular mortality of 1.59 (95% CI, 1.28–1.98) compared with subjects with blood lead < 5 µg/dL (Schober et al. 2006). In a 12-year longitudinal analysis of subjects  $\geq 17$  years of age ( $n = 13,946$ ), the relative risk for cardiovascular mortality was 1.53 (95% CI, 1.21–1.94), comparing a blood lead of 4.92 µg/dL (80th percentile of the distribution) with a blood lead of 1.46 µg/dL (20th percentile of the distribution) (Menke et al. 2006).

**Renal effects.** Renal injury that appears after acute high-dose lead exposure may include reversible deficits in proximal tubular reabsorption and prerenal azotemia induced by renal vasoconstriction and/or volume depletion (Coyle et al. 200; Wedeen et al. 1979). In a minority of exposed individuals, years of chronic, high-dose lead exposure may result in chronic lead nephropathy, a slowly progressive interstitial fibrosis characterized by scant proteinuria (Lilis et al. 1968). Epidemiologic investigations of renal function in workers with lower levels of chronic lead exposure have yielded variable findings. For example, in a cohort of approximately 800 current and former lead workers with mean

blood lead of  $32 \pm 15$  µg/dL, there was no significant linear relationship between blood lead concentration and two measures of renal function, serum creatinine and creatinine clearance (Weaver et al. 2003). There was an interaction between age and tibia lead concentration, a biomarker of cumulative lead exposure, on these same biomarkers, resulting in a trend toward worse renal function with increasing bone lead in the oldest tercile of workers ( $> 46$  years of age) but improved renal function with increasing bone lead in the youngest workers ( $\leq 36$  years of age). The authors suggested that lead-induced hyperfiltration, a finding noted in other studies, might presage the eventual development of lead-induced renal insufficiency. Both blood lead and tibia lead were correlated with increased urinary *N*-acetyl- $\beta$ -D-glucosaminidase (NAG), a biomarker of early biological effect on the renal tubule, but in an analysis of a smaller subset of the lead workers ( $n = 190$ ) that controlled for the relatively low levels of urinary cadmium ( $1.1 \pm 0.78$  µg/g creatinine), only the relationship with tibia lead and NAG remained significant (Weaver et al. 2003). Among a cohort of 70 active lead workers with a median blood lead concentration of 32 µg/dL (range, 5–47), there were modest correlations between blood lead and urinary  $\beta$ -2-microglobulin ( $r = 0.27$ ;  $p = 0.02$ ), and between cumulative blood lead index and NAG ( $r = 0.25$ ;  $p = 0.04$ ) (Gerhardsson et al. 1992).

Several studies conducted in general population samples have reported an association between blood lead concentration and common biomarkers of renal function (serum creatinine and creatinine clearance). In a cross-sectional investigation of a subcohort of middle-aged to elderly men enrolled in the Normative Aging Study ( $n = 744$ ), there was a negative correlation between blood lead (mean,  $8.1 \pm 3.9$  µg/dL; range, < 4.0–26.0 µg/dL) and measured creatinine clearance, after natural log transformation of both variables and adjustment for other covariates (Payton et al. 1994). Among an adult population that included subjects with environmental cadmium exposure [ $n = 965$  men (geometric mean blood lead, 11.4 µg/dL; range, 2.3–72.5 µg/dL);  $n = 1,016$  women (geometric mean blood lead, 7.5 µg/dL; range, 1.7–60.3 µg/dL)], log-transformed blood lead concentration was inversely correlated with measured creatinine clearance (Staessen et al. 1992). In a population-based study of Swedish women 50–59 years of age ( $n = 820$ ), low levels of blood lead (mean 2.2 µg/dL; 5th–95th percentiles, 1.1–4.6 µg/dL) were inversely correlated with creatinine clearance and glomerular filtration rate, after adjusting for age, body mass index, urinary or blood cadmium, hypertension, diabetes, and regular use

of nonsteroidal anti-inflammatory drug (NSAID) medication (Akesson et al. 2005).

Individuals with other risk factors for renal disease, notably hypertension and diabetes, may be more susceptible to an adverse impact of low-level lead exposure on renal function. Among adults participating in NHANES III ( $n = 15,211$ ), blood lead was a risk factor for elevated serum creatinine (defined as  $\geq 99$ th percentile of the analyte's race and sex specific distributions, generally  $> 1.2$ – $1.5$  mg/dL) and "chronic kidney disease" (defined as an estimated glomerular filtration rate  $< 60$  mL/min) only among subjects with hypertension ( $n = 4813$ ) (Muntner et al. 2003). Compared with hypertensives in the lowest quartile of blood lead (range, 0.7–2.4  $\mu$ g/dL), hypertensive subjects in the next highest quartile of blood lead (range, 2.5–3.8  $\mu$ g/dL) had a covariate adjusted OR for elevated serum creatinine of 1.47 (95% CI, 1.03–2.10) and for chronic kidney disease of 1.44 (95% CI, 1.00–2.09). At the next highest quartile of blood lead (range, 3.9–5.9  $\mu$ g/dL), the covariate-adjusted OR for elevated serum creatinine was 1.80 (95% CI, 1.34–2.42), and for chronic kidney disease it was 1.85 (95% CI, 1.32–2.59). In a subcohort of middle-aged to elderly men participating in the Normative Aging Study ( $n = 427$ , blood lead  $4.5 \pm 2.5$   $\mu$ g/dL), multiple regression analysis revealed that log-transformed blood lead was positively correlated with serum creatinine in hypertensive but not normotensive subjects (Tsaih et al. 2004). In a longitudinal study of this cohort over a mean of 6 years, an interaction between lead and diabetes yielded a positive association between baseline blood lead concentration and change in serum creatinine that was strongest in diabetic subjects (Tsaih et al. 2004). An interaction with diabetes was also present in the association of tibial lead concentration with longitudinal change in serum creatinine (Tsaih et al. 2004). Although these general population studies are consistent with an adverse effect of lead exposure on renal function at notably low levels, the extent to which diminished renal function may itself result in increased body lead burden has not been fully elucidated.

**Cognitive dysfunction.** A few studies examining relatively small numbers of workers ( $n \leq 100$ ) with blood lead concentrations ranging approximately 20–40  $\mu$ g/dL have associated lead exposure with subclinical decrements in selective domains of neurocognitive function (Barth et al. 2002; Hänninen et al. 1998; Mantere et al. 1984; Stollery 1996). Among a large cohort of current and former inorganic lead workers studied in Korea, a cross-sectional analysis ( $n = 803$  workers) (Schwartz et al. 2001) and a 3-year longitudinal analysis ( $n = 576$  workers)

(Schwartz et al. 2005) found that blood lead concentrations across the approximate range of 20–50  $\mu$ g/dL were associated with subclinical neurocognitive deficits. Among a small population of former lead workers ( $n = 48$ ) and age-matched controls with similar blood lead concentrations (approximately 5  $\mu$ g/dL in both groups; range, 1.6–14.5  $\mu$ g/dL; mean age, 39.8 years), increases in current blood lead concentration within the entire study population were correlated with poorer performance on several tests of neurocognitive function but on only one measure was cumulative lead exposure (measured in the workers) associated with poorer performance (Winker et al. 2005).

In the population-based sample of adults 20–59 years of age participating in the NHANES III study ( $n = 4937$ ), there was no relationship between blood lead concentration (geometric mean, 2.51  $\mu$ g/dL) and covariate-adjusted performance on neurocognitive function (Krieg et al. 2005). However, significant associations have emerged in some studies of older adults with slightly higher blood lead concentrations. In a rural subset of elderly women (mean age,  $71.1 \pm 4.7$  years;  $n = 325$ ) with background, community lead exposure (geometric mean blood lead concentration, 4.8  $\mu$ g/dL; range, 1–21  $\mu$ g/dL), certain measures of neuropsychologic function (Trailmaking part B and Digit Symbol test) were performed more poorly by women in the upper 15th percentile of blood lead (blood lead  $\geq 8$   $\mu$ g/dL,  $n = 38$ ; Muldoon et al. 1996). However, in the slightly younger subset of elderly women who resided in an urban area (mean age,  $69.4 \pm 3.8$  years;  $n = 205$ ), no relationship between blood lead (geometric mean, 5.4  $\mu$ g/dL) and neuropsychologic performance was discernible (Muldoon et al. 1996). In a general population sample of middle-aged to elderly men ( $n = 141$ ; mean age,  $66.8 \pm 6.8$  years) with a mean blood lead concentration of  $5.5 \pm 3.5$   $\mu$ g/dL examined as part of the Normative Aging Study, increased blood lead concentration was associated with poorer performance on neuropsychologic assessment of memory, verbal ability, and mental processing speed (Payton et al. 1998). In a larger subset of men ( $n = 736$ ; mean age,  $68.2 \pm 6.9$  years) from the Normative Aging Study assessed with the Mini-Mental Status Examination (MMSE), the OR for having a test score associated with an increased risk of dementia was 3.4 (95% CI, 1.6–7.2) comparing the mean blood lead of the highest quartile (mean, 8.9  $\mu$ g/dL) to that of the lowest quartile (mean, 2.5  $\mu$ g/dL) (Wright et al. 2003). There was a positive interaction between age and blood lead, which is consistent with a lead-associated acceleration in age-related neurodegeneration.

As reviewed in an accompanying article in this mini-monograph (Shih et al. 2007), there is evidence that at low levels of lead exposure, biomarkers of cumulative lead exposure, such as lead in bone, may be associated with an adverse impact on neurocognitive function that is not reflected by measurement of lead in blood. Among subjects from the Normative Aging Study ( $n = 466$ ; mean age,  $67.4 \pm 6.6$  years) examined for longitudinal change in MMSE score over an average of  $3.5 \pm 1.1$  years, higher patella bone lead concentrations, a biomarker of cumulative lead exposure, predicted a steeper decline in performance (Weisskopf et al. 2004). By comparison, baseline blood lead concentration (median, 4  $\mu$ g/dL; interquartile range = 3, 5) did not predict change in MMSE score. In a longitudinal analysis of performance on a battery of cognitive tests in a subset of the Normative Aging Study, bone lead measurements were predictive of worsening performance over time on tests of visuospatial/visuomotor ability (Weisskopf et al. 2007). In a cross-sectional analysis of 985 community dwelling residents 50–70 years of age, increasing tibia bone lead concentrations were significantly associated with decrements in cognitive function, whereas an impact of blood lead (mean,  $3.46 \pm 2.23$   $\mu$ g/dL) was not apparent (Shih et al. 2006).

**Reproductive outcome in women.** Adverse effects on reproductive outcome constitute a special risk of lead exposure to women of reproductive age. A nested case-control study examined the association of blood lead concentration with spontaneous abortion in a cohort of 668 pregnant women seeking prenatal care in Mexico City (Borja-Aburto et al. 1999). After matching for maternal age, education, gestational age at study entry, and other covariates, the OR for spontaneous abortion before 21 weeks gestation was 1.13 (95% CI, 1.01–1.30) for every 1  $\mu$ g/dL increase in blood lead across the blood lead range of 1.4–29  $\mu$ g/dL. Compared with the reference category of  $< 5$   $\mu$ g/dL of blood lead, women whose blood lead levels were 5–9, 10–14, and  $> 15$   $\mu$ g/dL had ORs for spontaneous abortion of 2.3, 5.4, and 12.2, respectively (test for trend,  $p = 0.03$ ). Although several earlier studies failed to detect this substantial impact, they may have been subject to methodologic limitations not present in the Mexico City investigation (Hertz-Picciotto 2000).

Several studies have found that lead exposure during pregnancy affects child physical development measured during the neonatal period and early childhood. In an extensively studied cohort of 272 full-term, parturient women from Mexico City with environmental lead exposure common to the region (mean maternal blood lead,  $8.9 \pm 4.1$   $\mu$ g/dL; mean

tibia bone lead,  $9.8 \pm 8.9 \mu\text{g/g}$ ; range, 12–38  $\mu\text{g/g}$ ), every increase of 10  $\mu\text{g/g}$  in maternal tibia lead was associated with a 73-g (95% CI, 25–121) decrease in birth weight (Gonzalez-Cossio et al. 1997). The impact of tibia bone lead on birth weight was nonlinear and was most pronounced in mothers with the highest quartile of bone lead ( $> 15\text{--}38 \mu\text{g/g}$ ) where the decrement relative to the lowest quartile was estimated to be 156 g. Primarily in the same cohort, a maternal patella lead concentration  $> 24.7 \mu\text{g/g}$  was associated with an OR of 2.35 (95% CI, 1.26–4.40) for a neonate with one category smaller head circumference at birth, assessed as a five-category-ordered variable (Hernandez-Avila et al. 2002). In a different Mexico City cohort, each doubling of maternal blood lead at 36 weeks of pregnancy (geometric mean, 8.1  $\mu\text{g/dL}$ ; 25th–75th percentile, 5–12  $\mu\text{g/dL}$ ) was associated with a decrease of 0.37 cm (95% CI, 0.57–0.17) in the head circumference of a 6-month-old infant (Rothenberg et al. 1999b).

Prenatal lead exposure assessed by umbilical cord blood lead concentration has been inconsistently associated with an adverse effect on neurobehavioral development in childhood. However, recent studies suggest that mobilization of maternal bone lead during pregnancy may contribute to fetal lead exposure in ways that may be incompletely reflected by the single measurement of umbilical cord whole-blood lead (Chuang et al. 2001; Tellez-Rojo et al. 2004). In a prospective study conducted in Mexico City of 197 mother–infant pairs, a statistically significant adverse effect of umbilical cord blood lead (mean,  $6.7 \pm 3.4 \mu\text{g/dL}$ ; range, 1.2–21.6  $\mu\text{g/dL}$ ) was also accompanied by an independent adverse effect of maternal bone lead burden on the 24-month Mental Development Index (MDI) of the Bayley Scales of Infant Development, which decreased 1.6 points (95% CI, 0.2–3.0) for every 10- $\mu\text{g/g}$  increase in maternal patellar lead (mean,  $17.9 \pm 15.2 \mu\text{g/g}$ ; range,  $< 1\text{--}76.6 \mu\text{g/g}$ ) (Gomaa et al. 2002).

A prospective study that measured maternal plasma lead and maternal whole-blood lead during pregnancy found that maternal plasma lead during the first trimester was the stronger predictor of infant mental development at 24 months of age (Hu et al. 2006). In this cohort, first trimester maternal plasma lead was  $0.016 \pm 0.014 \mu\text{g/dL}$  and first trimester maternal whole-blood lead was  $7.07 \pm 5.10 \mu\text{g/dL}$  ( $n = 119$ ). Adjusting for covariates that included maternal age, maternal IQ, child sex, childhood weight and height for age, and childhood whole-blood lead at 24 months, an increase of one SD in  $\log_e$  (natural log)–transformed plasma lead in the first trimester was associated with a 3.5-point decrease in score on the 24-month

MDI of the Bayley Scales of Infant Development. The corresponding impact of one SD increase in  $\log_e$  maternal whole blood during the first trimester was a 2.4-point decrease in the 24-month MDI. The logarithmic relationship between maternal plasma and blood lead concentrations and infant MDI indicated that the strongest effects occurred among mothers with the lowest plasma and blood lead concentrations.

Two long-term prospective studies that conducted multiple measurements of maternal blood lead during pregnancy and childhood have identified an adverse impact of low-level prenatal lead exposure on postnatal neurobehavioral development extending beyond infancy. Applying a repeated measures linear regression technique to analysis of age-appropriate IQ test data obtained in 390 children 3–7 years of age, the Yugoslavia Prospective Lead Study found independent adverse effects of both prenatal and postnatal blood lead. After controlling for the pattern of change in postnatal blood lead and other covariates, IQ decreased 1.8 points (95% CI, 1.0–2.6) for every doubling of prenatal blood lead, which was assessed as the average of maternal blood lead at midpregnancy and delivery (mean,  $10.2 \pm 14.4 \mu\text{g/dL}$ ;  $n = 390$ ) (Wasserman et al. 2000). The Mexico City Prospective Lead Study used generalized linear mixed models with random intercept and slope to assess the impact on IQ measured at 6–10 years of age of blood lead measurements systematically obtained during weeks 12, 20, 24, and 36 of pregnancy, at delivery, and at multiple points throughout childhood (Schnaas et al. 2006). Geometric mean blood lead during pregnancy was 8.0  $\mu\text{g/dL}$  (range, 1–33  $\mu\text{g/dL}$ ;  $n = 150$ ); from 1 through 5 years it was 9.8  $\mu\text{g/dL}$  (2.8–36.4  $\mu\text{g/dL}$ ), and from 6 through 10 years it was 6.2  $\mu\text{g/dL}$  (range, 2.2–18.6  $\mu\text{g/dL}$ ). IQ at 6 to 10 years of age, assessed by the Wechsler Intelligence Scale for Children—Revised, decreased significantly only with increasing natural-log third-trimester blood lead, controlling for other blood lead measurements and covariates. Every doubling of third trimester blood lead (geometric mean of maternal blood lead at weeks 28 and 36 = 7.8  $\mu\text{g/dL}$ , 5th–95th percentile: range, 2.5–24.6  $\mu\text{g/dL}$ ) was associated with an IQ decrement of 2.7 points (95% CI, 0.9–4.4). Notably, the nonlinear (i.e., log-linear) relationships detected in the Yugoslavia and Mexico City studies indicate that across a maternal blood lead range of 1–30  $\mu\text{g/dL}$ , an increase in blood lead from 1 to 10  $\mu\text{g/dL}$  will account for more than half the IQ decrement.

Two independent cohorts have provided evidence that maternal lead burden during pregnancy may be associated with increased risk of pregnancy hypertension and/or elevated blood pressure during pregnancy. In a

retrospective study of 3,210 women during labor and delivery, increasing umbilical cord blood lead levels (mean,  $6.9 \pm 3.3 \mu\text{g/dL}$ ; range, 0–35  $\mu\text{g/dL}$ ) were associated with increased systolic blood pressure during labor (1.0 mmHg for every doubling of blood lead) and increased odds of hypertension (not further defined) recorded any time during pregnancy (OR = 1.3; 95% CI, 1.1–1.5) for every doubling of blood lead (Rabinowitz et al. 1987). A prospective study of third trimester blood lead (geometric mean,  $2.3 \pm 1.4 \mu\text{g/dL}$ ; range, 0.5–36.5  $\mu\text{g/dL}$ ) in 1,188 predominantly Latina immigrants showed that, in the immigrants, every doubling in blood lead was associated with increased third-trimester systolic blood pressure (1.2 mmHg; 95% CI, 0.5–1.9) and diastolic blood pressure (1.0 mmHg; 95% CI, 0.4–1.5) (Rothenberg et al. 1999a). A study of a subset of the same cohort ( $n = 637$ ) without regard to immigration status found that every 10- $\mu\text{g/g}$  increase in calcaneus (heel) bone lead increased the OR of third trimester pregnancy hypertension (systolic  $> 90$  and/or diastolic  $> 140$  mmHg) by 1.86 (95% CI, 1.04–3.32) (Rothenberg et al. 2002).

### Medical Surveillance for Lead-Exposed Workers

The OSHA workplace standard for lead exposure in general industry (adopted in 1978) and a corresponding standard for lead exposure in construction trades (adopted in 1993) set forth medical surveillance requirements that include baseline and periodic medical examinations and laboratory testing. Details of the two standards, which establish distinct criteria for the implementation of surveillance, can be found on the OSHA website (OSHA 2002). Because of the concern regarding adverse health effects of lead associated with the lower levels of exposure discussed in this article, we recommend a revised schedule of medical surveillance activities (Table 2). Unlike the OSHA medical surveillance requirements, which apply only to workers exposed to airborne lead levels  $\geq 30 \mu\text{g/m}^3$  as an 8-hr time-weighted average, the recommendations in Table 2 are intended to apply to all lead-exposed workers who have the potential to be exposed by lead ingestion, even in the absence of documented elevations in air lead levels (Sen et al. 2002). As shown in Table 2, the level of a worker's current blood lead measurement, as well as possible changes in lead-related exposure, influences the recommended time interval for subsequent blood lead measurements. Blood lead measurements should be obtained from a clinical laboratory that has been designated by OSHA as meeting the specific proficiency requirements of the OSHA lead standards. OSHA maintains a list of these laboratories

on its website (OSHA 2005). Venous blood should be used for biological monitoring of adult lead exposures, except where prohibited by medical or other reasons. Routine measurement of zinc protoporphyrin, a requirement of the OSHA lead standards, is not recommended in Table 2 because it is an insensitive biomarker of lead exposures in individuals with blood lead concentrations < 25 µg/dL (Parsons et al. 1991).

The content of the baseline or preplacement history and physical examination for lead-exposed workers should continue to follow the comprehensive scope set forth in the OSHA lead standard for general industry. Measurement of serum creatinine will identify individuals with chronic renal dysfunction who may be subject to increased health risks from lead exposure. With the potential exception of an annual blood pressure measurement and a brief questionnaire regarding the presence of medical conditions (such as renal insufficiency) that might increase the risk of adverse health effects of lead exposure, medical evaluations for lead-exposed workers should be unnecessary as long as blood lead concentrations are maintained < 20 µg/dL. Annual education of lead workers regarding the nature and control of lead hazards, and ongoing access to health counseling regarding lead-related health risks are recommended as preventive measures.

## Lead Exposure during Pregnancy and Lactation

As summarized earlier in this article, the recent findings concerning lead-related adverse reproductive outcomes render it advisable for pregnant women to avoid occupational or avocational lead exposure that would result in blood lead concentrations > 5 µg/dL. Calcium supplementation during pregnancy may be especially important for women with past exposure to lead. Calcium decreases bone resorption during pregnancy (Janakiraman et al. 2003) and may minimize release of lead from bone stores and subsequent fetal lead exposure (Gomaa et al. 2002).

Maternal body lead burden and external lead exposure influence the lead concentration of breast milk (Ettinger et al. 2006; Gulson et al. 1998). The few studies that used ultraclean techniques and mass spectrometry analyses report human breast milk concentrations ranging from 0.6 to 3% of maternal blood lead (Ettinger et al. 2004b; Gulson et al. 1998; Manton et al. 2000; Sowers et al. 2002). Using 1% as a guide, it can be estimated that nursing mothers with a blood lead concentration < 20 µg/dL will have breast milk with a concentration < 2 µg/L, a value that approximates the amount of lead in infant formula (Gulson et al. 2001). A recent randomized clinical

trial among Mexican women with mean blood lead concentrations of approximately 9 µg/dL found that calcium supplementation during lactation may reduce the lead concentration of breast milk by 5–10% (Ettinger et al. 2006). Breast feeding should be encouraged for almost all women (Ettinger et al. 2004a; Sanin et al. 2001; Sinks and Jackson 1999), with decisions concerning women with very high lead exposure addressed on an individual basis.

## Medical Treatment of Elevated Blood Lead Concentration and Overt Lead Intoxication

Removal from all sources of hazardous lead exposure, whether occupational or nonoccupational, constitutes the first and most fundamental step in the treatment of an individual with an elevated blood lead concentration. A careful history that inquires about a broad spectrum of potential lead sources is recommended (Occupational Lead Poisoning Prevention Program 2006). Removal from occupational lead exposure will usually require transfer of the individual out of any environment or task that might be expected to raise the blood lead concentration of a person not using personal protective equipment above background levels (i.e., 5 µg/dL). If there has been a history of an affected individual bringing lead-contaminated shoes, work clothes, or equipment home from the workplace, evaluation of vehicles and the home environment for significant levels of lead-containing dust might be considered (Piacitelli et al. 1995). Although such "take-home" exposure might contribute to further lead exposure of the worker, it ordinarily poses more of a potential risk to young children and pregnant or nursing women who share the worker's home environment (Hipkins et al. 2004; Roscoe et al. 1999).

Medical treatment of individuals with overt lead intoxication involves decontamination, supportive care, and judicious use of chelating agents. Comprehensive discussion of such treatment is beyond the scope of this article but has been reviewed in recent medical toxicology texts (Kosnett 2001, 2005). A variety of chelating agents has been demonstrated to decrease blood lead concentrations and increase urinary lead excretion. A recent double-blind randomized clinical trial of oral chelation in young children with blood lead concentrations ranging from 22 to 44 µg/dL found that the drug succimer lowered blood concentrations transiently but did not improve cognitive function (Dietrich et al. 2004; Rogan et al. 2001). Although anecdotal evidence suggests that chelation has been associated with improvement in symptoms and decreased mortality in patients with lead encephalopathy, controlled clinical trials demonstrating efficacy are lacking. Treatment recommendations are therefore mostly empiric, and decisions regarding the initiation of chelation therapy for lead intoxication have occasionally engendered controversy.

In our experience, adults with blood lead concentrations ≥ 100 µg/dL almost always warrant chelation, as levels of this magnitude are often associated with significant symptoms and may be associated with an incipient risk of encephalopathy or seizures. Occasionally, patients with very high blood lead concentrations may have no overt symptoms. Patients with blood lead concentrations of 80–99 µg/dL, with or without symptoms, can be considered for chelation treatment, as may some symptomatic individuals with blood lead concentrations of 50–79 µg/dL. These demarcations are imprecise, however, and decisions on chelation should be made on a case-by-case basis after consultation with an

**Table 2.** Health-based medical surveillance recommendations for lead-exposed workers.

Category of exposure	Recommendations
All lead-exposed workers <sup>a</sup>	Baseline or preplacement medical history and physical examination, baseline BLL, serum creatinine
BLL (µg/dL)	
10–19	See Table 1 for pregnancy concerns As above for BLL < 10 µg/dL, plus: BLL every 3 months Evaluate exposure, engineering controls, and work practices Consider removal (see Table 1) Revert to BLL every 6 months after 3 BLLs < 10 µg/dL
	monitor as above

BLL, blood lead level.

<sup>a</sup>Lead-exposed means handling or disturbing materials with a significant lead content in a manner that could reasonably be expected to cause potentially harmful exposure through inhalation or ingestion.

experienced specialist in occupational medicine or medical toxicology.

Hair lead analysis or measurement of urine lead concentration seldom provide exposure information of clinical value beyond that provided by the history and the measurement of blood lead concentration. Chelation initiated exclusively on the basis of hair or urine lead levels or chelation of asymptomatic individuals with low blood lead concentrations is not recommended.

Adults with overt lead intoxication will generally experience improvement in symptoms after removal from lead exposure and decline in blood lead concentration. This clinical observation on improvement in overt symptoms finds some support from the relatively limited number of studies that have examined the impact of naturally declining blood lead concentrations on cognitive function in occupationally exposed subjects (Chuang et al. 2005; Lindgren et al. 2003; Winker et al. 2006). Improvement or resolution of neurocognitive or neurobehavioral symptoms may sometimes lag the decline in blood lead concentration, possibly because of the relatively slower removal of lead from the central nervous system (Cremin et al. 1999; Goldstein et al. 1974). The pace of improvement can be highly variable, and may range from weeks to a year or more depending on the magnitude of intoxication. Anecdotal experience and analogy to other forms of brain injury suggest a potential role for rehabilitative services (e.g., physical therapy, cognitive rehabilitation) in enhancing the prospect for recovery, and in demonstrating the capacity for safe return to work. Short-term improvement in neurocognitive function associated with a decline in blood lead concentration does not obviate concern that long-term cumulative lead exposure may nonetheless have a deleterious effect on cognitive reserve, and may accelerate age-related decline in cognitive function (Schwartz et al. 2005; Weisskopf et al. 2004).

## Additional Management Considerations

With appropriate engineering controls, safe work practices, and personal protective equipment, workers without a previous history of substantial lead exposure should be able to work with lead in a manner that minimizes the potential for hazardous levels of exposure. For such workers, elevations in blood lead concentration that result from unforeseen transient increases in exposure will often decline promptly once the exposure is controlled. However, in a worker with a long history of high exposure, redistribution of lead from a large internal skeletal burden may result in a prolonged elevation of blood lead concentration despite marked reductions in external lead dose.

The recommendations for management of adult lead exposure contained in this article are derived from consideration of risks to health, and have not been the subject of a cost-benefit analysis examining economic feasibility or social impacts. Nonmedical, socioeconomic factors will likely influence how workers, employers, and clinicians respond to the recommendations. In particular, the blood lead concentrations for which some major interventions, such as removal from lead exposure, are recommended are considerably lower than those explicitly specified in the current OSHA lead standards (OSHA 2002). The OSHA standards do require an employer to implement reductions in exposure recommended by a physician who determines an employee has a "detected medical condition" that places him or her at increased risk of "material impairment to health." This nonspecific provision could form the basis for implementation of protective workplace action at the lower blood concentrations recommended by the authors. Nonetheless, clinicians should inform patients that such recommendations may be contested by an employer or an insurer, and could potentially jeopardize their job benefits or work

status. Prudent case management that considers the worker's perspective on their unique health risks and employment situation will usually be advisable.

## Interpretative Guidance for Clinical Laboratory Report Forms

Clinical laboratories routinely offer brief interpretative guidance on the forms that report the result of blood lead concentrations. There is considerable variability among laboratories regarding the content of such guidance, and laboratories exercise their own discretion regarding the source and detail of the information they provide. Unlike the management guidance chart for childhood blood lead concentrations published by the CDC (2002), which is often reproduced by clinical laboratories, no corresponding CDC guidance exists for blood lead concentrations measured in adults. Notwithstanding the limitations inherent in an abbreviated tabular format, Table 3 represents a guidance chart for adult blood lead measurements that is proposed for use by clinical laboratories.

**Table 3.** Recommended interpretive guidance for clinical laboratories reporting adult blood lead concentrations.

Blood lead level (µg/dL)	Management recommendations and requirements <sup>a</sup> for adults
< 5	No action needed
5–9	Discuss health risks
	Reduce exposure for pregnancy
10–19	Discuss health risks. Decrease exposure. Monitor BLL
	Remove from exposure for pregnancy, certain medical conditions, long-term risks
20–29	Remove from exposure if repeat BLL in 4 weeks remains ≥ 20 µg/dL
30–79	Remove from exposure. Prompt medical evaluation and consultation advised for BLL > 40 µg/dL
	OSHA requirements may apply
	Chelation not indicated unless BLL > 50 µg/dL with significant symptoms

BLL, blood lead level. Primary management of lead poisoning is source identification and removal from exposure. A single BLL does not reflect cumulative body burden or predict long-term effects.

<sup>a</sup>Refer to OSHA general industry and construction lead standards for occupational exposure.

Medical Management Guidelines for Lead-Exposed Adults  
Association of Occupational and Environmental Clinics

## Medical Management Guidelines for Lead-Exposed Adults

### Revised 04/24/2007

#### Summary:

Overexposure to inorganic lead continues to be an important problem worldwide. The reduction of lead in the U.S. environment, largely accomplished through effective EPA regulatory efforts, has resulted in lowering the overall geometric mean whole blood lead level (BLL) for the general population in the United States from approximately 13  $\mu\text{g/dL}$  ( $0.63 \mu\text{mol/L}$ ) in the 1970s to less than 2  $\mu\text{g/dL}$  ( $0.10 \mu\text{mol/L}$ ) (CDC 2005; NCHS 1984). Lead exposure remains a significant public health and medical concern for thousands of children and adults exposed primarily through remaining lead-based paint in older housing stock as well as to workplace exposures, although other sources occur. For children and adults, the role of environmental investigation, identification and reduction or elimination of sources of exposure remains of primary importance. While the clinical care of lead-exposed children has been well established in the pediatric and public health communities, similar clinical recommendations for adults have not been widely available.

The purpose of this document is to provide useful advice to clinicians caring for adult patients who have been exposed to lead, whether at work, at home, through hobbies, in the community, through consumer products, retained bullets, or other sources. This document is derived, in part, from the input of an expert panel convened by the Association of Occupational and Environmental Clinics (AOEC). However, three clinical scholars then considered the medical evidence submitted by the expert panel and incorporated many of the conclusions reached by this panel. This paper, therefore, reflects a general consensus of the clinical views of AOEC members, not necessarily the expert panel, particularly in areas where the expert panel had been unable to come to consensus. The following points are emphasized:

- 1) Medical care serves as an adjunct to public health and industrial hygiene exposure control. Clinicians who evaluate patients with potential lead exposure should have appropriate referral mechanisms in place for prevention of further exposure to lead. Although one goal of health care is to remove the patient from exposure, the social consequences of potential disruption of housing or of income may be important and must be considered by the clinician.
- 2) Current occupational standards are not sufficiently protective and should be strengthened. Although the federal Occupational Safety and Health Administration's (OSHA) lead standards have provided guidance that has been beneficial for lead-exposed workers, these regulations have not been substantially changed since the late 1970s and thus are primarily based on health effects studies that are well over three decades old. There is an urgent need to revise them.
- 3) The clinical guidelines presented here are appropriate for adults, recognizing that younger adults, particularly those in workplace settings, may share developmental risks that place them closer to pediatric populations, and that maternal exposure, whether in the workplace or in the general environment, places the developing fetus at risk for exposure.

4) Clinicians should feel free to contact any of the member AOEC clinics for additional telephone advice, and are encouraged to refer patients when appropriate.

## **Background**

Lead is used in over 100 industries. Job activities known to involve the use or disturbance of lead include: handling of lead-containing powders, liquids, or pastes; production of dust or fumes by melting, burning, cutting, drilling, machining, sanding, scraping, grinding, polishing, etching, blasting, torching, or welding lead-containing solids; and dry sweeping of lead-containing dust and debris. Adults also encounter lead in environmental settings and through activities such as home remodeling, particularly in homes built before 1978 that contain lead-based paint, lead-contaminated consumer products, traditional remedies, moonshine whiskey, hobbies, such as melting lead sinkers or use of target ranges, from retained bullets, and through other sources.

Lead is not an essential element and serves no useful purpose in the body. A substantial body of recent research demonstrates that multiple health effects can occur at levels once considered safe. The routes of exposure for inorganic lead are inhalation and ingestion. Once absorbed, lead is found in all tissues, but eventually 90% or more of the body burden is accumulated (or redistributed) into bone with a biological half-life of years to decades. Lead is excreted primarily in the urine. Lead does not remain in the bone permanently but is slowly released back into the blood.

The “dose” or quantity of lead that a person receives will be determined by the concentration of lead in the air and/or the amount ingested as well as the duration of such exposure. The BLL remains the predominant biological marker used in clinical assessment, workplace monitoring, public health surveillance, and regulatory decisions regarding removal from exposure under the OSHA lead standards.

Research tools capable of measuring cumulative lead exposure, such as the use of in-vivo K-shell X-ray fluorescence (K-XRF) instruments for the rapid, non-invasive measurement of lead in bone, have expanded recent understanding of long-term consequences from lead exposure on a population basis. These studies have demonstrated adverse effects of lead exposure across populations, including on neurologic, reproductive and renal function and on blood pressure, that occur at extremely low levels of exposure and appear not to have a threshold. However, because inter-individual differences are greater than population differences at lower lead levels, these effects are less important for clinical evaluation than they are for public health policy. The preponderance of the evidence for adverse effects at levels of exposure far below those currently permitted by OSHA speaks forcefully for an immediate reduction in permissible exposure levels in the workplace and for enhanced public health attention to those sources, including among self employed individuals, not currently subject to OSHA regulation.

Because lead interferes with biochemical processes occurring in cells throughout the body, adverse effects occur in multiple organ systems. The non-uniformity of symptoms that appear in exposed individuals, as well as a growing body of epidemiologic studies, suggest that wide variation exists in individual susceptibility to lead poisoning. Early overt symptoms in adults are often subtle and nonspecific, involving the nervous, gastrointestinal, or musculoskeletal systems. High levels of exposure can result in delirium, seizures, stupor, coma, or lead colic. Other overt signs and symptoms include hypertension, peripheral neuropathy, ataxia, tremor, gout, nephropathy, and anemia. In general, symptoms increase with increasing BLLs.

In addition to exposure that occurs from external sources, carefully performed lead isotope studies demonstrated that pregnancy and lactation are both associated with large increases in the release of lead from the maternal skeleton (Gulson et al. 2003). High levels of lead in women's bones at the time of childbirth corresponded to lower birth weight (Gonzalez-Cossio et al. 1997), lower weight gain from birth to one month of age (Sanin et al. 2001), and reduced head circumference and birth length (Hernandez-Avila et al. 2002).

In males, abnormal sperm morphology and decreased sperm count have been observed at BLLs of approximately 40 µg/dL (1.93 µmol/L) or less (Telisman et al. 2000). In the absence of effects on sperm count or concentration, the impact of paternal lead exposure on reproductive outcome is uncertain.

Recent research has examined several genetic polymorphisms that may influence lead uptake, distribution, and target organ toxicity. However, at this point in time, research findings are insufficient to conclusively identify subpopulations that may have increased susceptibility to lead toxicity based on specific genotypes. Other factors that might modify the risk of lead toxicity include pre-existing disease affecting relevant target organs (such as diabetic nephropathy or borderline hypertension), nutritional deficiencies (particularly of dietary cations such as iron and calcium), ethnicity, and aging.

## **CLINICAL ASSESSMENT OF LEAD EXPOSURE**

Taking a detailed medical and occupational/environmental history is a fundamental step in the assessment of a person with lead exposure. It is important to ask about exposure to lead in current and previous jobs (Table 1), protections used, biological and air monitoring data, hygiene practices, knowledge and training, hobbies, traditional medications, moonshine use and other non-occupational sources (Table 2). A medical and reproductive history is essential in identifying individuals at increased risk of adverse health effects from lead exposure. Table 3 summarizes symptoms and target organ toxicity of lead at progressive BLLs. Physical exam findings in lead poisoning are frequently lacking. Gingival lead lines and wrist or foot drop are rarely seen.

## Blood Lead Level and Zinc Protoporphyrin

The BLL is the most convenient and readily interpretable of the available lead biomarkers. It is mainly an estimate of recent external exposure to lead, but it is also in equilibrium with bone lead stores. The BLL alone is not a reliable indicator of prior or cumulative dose or total body burden; nor can a single BLL be used to confirm or deny the presence of chronic health effects thought due to lead exposure. The “normal” or “reference range” BLL is less than 5 µg/dL (0.24 µmol/L) for more than 90% (CDC 2005) of the adult population. When interpreting the BLL, key questions are whether the exposure has been 1) of short-term or long-term duration; 2) recent or in the remote past; and 3) of high or low intensity.

Erythrocyte protoporphyrin IX (EP), which can be measured as free EP (FEP) or zinc protoporphyrin (ZPP), is a measurement of biological effect and is an indirect reflection of lead exposure. Lead affects the heme synthesis pathway. Increases in EP or ZPP are not detectable until BLLs reach 20 to 25 µg/dL, (0.97-1.21 µmol/L) followed by an exponential rise relative to increasing BLLs. An increase in EP or ZPP usually lags behind an increase in BLL by two to six weeks.

Periodic testing of BLL and ZPP, called biological monitoring, is required by the OSHA lead standards for workers exposed to significant levels of airborne lead.

## Other Laboratory Tests

Depending on the magnitude of lead exposure, a complete blood count, serum creatinine, blood urea nitrogen, and complete urinalysis may be indicated. Evaluation of reproductive status may be pertinent for some lead-exposed adults.

It is important to check BLLs of family members, particularly children, of lead-exposed individuals. Lead workers may unwittingly expose their families to lead dust brought home on clothes, shoes and in cars.

Except for rare circumstances, there is little or no value in measuring lead in urine or hair. Because of the pharmacokinetics of lead clearance, urine lead changes more rapidly and may vary independently of BLL. Urine lead is less validated than BLL as a biomarker of external exposure, or as a predictor of health effects. Lead in hair may be a reflection of external contamination rather than internal lead dose; laboratory analysis is not standardized.

## EXPOSURE INVESTIGATION

The occupational and environmental exposure history is the first step in identifying the source of the lead exposure. Both because the cornerstone of intervention is source removal or reduction and because others may be at risk from exposure, the first step is to identify the source. A list of US Environmental Protection Agency accredited laboratories is available at <http://www.epa.gov/lead/nllaplist.pdf>. Assistance, especially for non-occupational problems such as herbal remedies, candy, moonshine etc. is available from the local and/or state health departments at [http://www.apha.org/public\\_health/state.htm](http://www.apha.org/public_health/state.htm).

The clinician, with the patient's permission, should also contact the employer for further exposure information, such as air level monitoring, biologic monitoring and Material Safety Data Sheets (MSDSs). Work related exposure measurements should be readily available to the clinician. The federal OSHA standards are available at <http://www.osha.gov/SLTC/lead/standards.html>. Small businesses can obtain information at <http://www.osha.gov/dcsp/smallbusiness/index.html>

## HEALTH-BASED MEDICAL MANAGEMENT

The single most important aspect of treating lead poisoning is removal from exposure, yet there may be important socioeconomic constraints for a given individual that limit this approach. For this reason, the panel and the AOEC petition OSHA to update the requirements of the current lead standards and urge clinicians to engage public health and industrial hygiene professionals whenever lead exposure is suspected.

Documented health risks and medical management recommendations are summarized in Table 4. The table presents recommendations for a broad range of BLLs. Although the BLL range is categorized in discrete steps, the outcomes will not neatly conform to these arbitrary divisions, and expectation of health effects in the BLL categories will also be influenced by cumulation of dose. For example, clinical peripheral neuropathy can be present at the high end of the BLL 40 to 79  $\mu\text{g/dL}$  (1.93–3.81  $\mu\text{mol/L}$ ) range, while it would not be expected to occur from lead exposure at the low end of the same range. The table is intended to assist clinicians in discussing the short-term and long-term health risks of lead exposure with their patients.

There are other instances where removal from lead exposure is warranted that are consistent with the OSHA lead standards. In addition to specific “trigger” BLLs for medical removal protection (MRP), under the OSHA lead standards (e.g. BLL 50  $\mu\text{g/dL}$  (2.41  $\mu\text{mol/L}$ ) or greater) the physician can remove an individual from lead work due to a medical condition which places the employee “at increased risk of material impairment to health from exposure to lead”, chronic renal dysfunction (serum creatinine > 1.5  $\text{mg/dL}$  (133  $\mu\text{mol/L}$ ) for men, > 1.3  $\text{mg/dL}$  (115  $\mu\text{mol/L}$ ) for women, or proteinuria), hypertension, neurological disorders, cognitive dysfunction, and pregnancy.

Central nervous system effects may have a delayed onset and may sometimes persist well after the BLL has dropped below the BLLs at which the OSHA lead standards permit return to work. These persistent effects could negatively impact work performance and safety in certain jobs. Anecdotal evidence, and analogy to other neurotoxic injury, suggests that individuals who develop overt neurological signs and symptoms from lead exposure above that permissible under current OSHA regulations may benefit from rehabilitative measures (e.g., physical therapy, cognitive rehabilitation) that have been used effectively in patients with other brain injuries, such as traumatic brain injury or stroke. Participation in a rehabilitation

program may enhance the prospect for recovery, and may demonstrate the worker's capacity to safely return to work.<sup>1</sup>

## Medical Surveillance

Medical surveillance is an essential part of an employer's lead safety program and includes biological monitoring with periodic BLL testing, medical evaluation, and treatment if needed, and intervention to prevent or control identified exposure. The BLL is the best available measure of total exposure from both inhalation and ingestion. Biological monitoring provides feedback to the employer and worker about the efficacy of workplace controls, helps avoid surprises, and saves costs such as medical removal.

Currently, under the OSHA standards, a worker must be included in a lead medical surveillance program if his/her airborne lead exposure is  $30 \mu\text{g}/\text{m}^3$  (eight-hour time-weighted average) or higher for more than 30 days per year. The panel believes that the trigger for medical surveillance should not rely solely on air monitoring results; instead, workers should be included in a medical surveillance program whenever they are handling or disturbing materials with a significant lead content in a manner that could reasonably be expected to cause potentially harmful exposure through inhalation or ingestion.

A medical surveillance program with increased frequency of BLL testing and early intervention for all lead-exposed workers is recommended to reduce health risks. The panel does not recommend routine ZPP testing as an early biomarker of lead toxicity; however, ZPP measurement is required by OSHA for certain levels of lead exposure. New employees and those newly assigned to lead work should have a preplacement lead medical examination and BLL test, followed by periodic BLL testing, blood pressure measurement, and health status review. Monthly BLL testing is recommended for the first three months of employment for an initial assessment of the adequacy of exposure control measures. Subsequently, testing frequency can be reduced to every six months as long as BLLs remain below  $10 \mu\text{g}/\text{dL}$  ( $0.48 \mu\text{mol}/\text{L}$ ). Any increase in BLL of  $5 \mu\text{g}/\text{dL}$  ( $0.24 \mu\text{mol}/\text{L}$ ) or greater should be addressed by re-examining control measures in place to see where improvements should be made and by increasing BLL monitoring if needed. If the task assignment changes to work with significantly higher exposures, the initial BLL testing schedule of monthly tests for the first three months at this task should be repeated.

The above schedule for BLL testing may be inadequate for certain situations where the exposures are very high and/or highly variable. In these situations, the BLL testing schedule should be tailored to address the special risks of different types of work and exposures. For example, a construction worker may have very high, intermittent exposures in contrast to someone working in a battery plant or other general industry setting with significant exposures but less day-to-day variability. Employees assigned to tasks where exposures are extremely high (e.g., abrasive blasting) should be tested more frequently than as recommended above,

i.e., at least monthly. In general, it is a good idea to do BLL testing at peak exposures to assess controls and, specifically for the construction trades, to test pre-, mid-, and post-job.

Because of the significant reduction of lead in the general environment, new workers enter lead jobs with very low BLLs while others who have worked with lead often have much higher BLLs and body burdens. With increased biological monitoring frequency to ensure that low BLLs are maintained, it is possible that some workers with lead-related health risks may be able to work safely in a lead-exposed environment. All lead-exposed workers should receive education about the health effects of lead and prevention information from the clinician and the employer, and they should be provided necessary protections including protective clothing, clean eating areas, and hygiene measures such as wash-up facilities and/or showers to prevent both ingestion of lead and take-home exposures.

## Chelation Therapy

Primary management for adult lead poisoning is identification of the lead source and cessation of exposure. In adults, chelation therapy generally should be reserved for individuals with high BLLs and/or significant symptoms or signs of toxicity. There is no evidence-based guidance in this regard because of lack of appropriate studies.

Based upon the clinical experience and judgment of panel members, the following general recommendations concerning chelation are offered: chelation therapy is *recommended* for adults with BLLs 100 µg/dL (4.83 µmol/L) or greater, can be *strongly considered* for BLLs 80 to 99 µg/dL (3.86-4.78 µmol/L), and *possibly considered* for BLLs between 50 and 79 µg/dL (2.41-3.81 µmol/L) in the presence of lead-related symptoms. BLLs greater than 100 µg/dL (4.83 µmol/L) almost always warrant chelation as they are usually associated with significant symptoms and may be associated with an incipient risk of encephalopathy or seizures. These are general recommendations and clinicians may vary appropriately from these recommendations depending upon circumstances. Adults with a very high BLL (e.g., 90 µg/dL (4.34 µmol/L)) may remain asymptomatic. Oral chelation has largely supplanted parenteral agents. Chelation therapy relies on enhancing renal excretion, and remobilization of lead from other body stores may occur. Guidance on administration of chelating agents is available in several publications (e.g. Kosnett 2004). Clinicians unfamiliar with chelation protocols are encouraged to contact AOEC clinics (<http://www.aoec.org/directory.htm> or 1-888-347-2632) or with other physicians experienced in treating adults with lead poisoning for additional advice prior to instituting treatment.

On a population basis it is important to reduce fetal exposure to lead, and maternal lead levels less than 5 µg/dL are optimal. However, laboratory measures are not absolutely precise, and clinical judgment is needed in every patient encounter. Chelation should be used during pregnancy **ONLY** to protect the life and health of the mother and **ONLY** if the potential benefit to the mother justifies the potential risk to the fetus. This decision will need to be made on a case by case basis by the attending physician. Because of the increase in lead mobilized from maternal bone during pregnancy, clinicians should be aware that maternal blood lead levels may exhibit an upward trend in the second and third trimesters even in the absence of further

exposure. Women with a history of long-term lead exposure or prior elevated BLL's should be monitored regularly during pregnancy for BLL elevation. If the occupational history or clinical evaluation suggests elevated bone lead stores, clinicians may wish to counsel patients on delaying conception until the risk of mobilization of lead from bone depots has been reduced.

Prophylactic chelation therapy of lead-exposed workers, to prevent elevated BLLs or to routinely lower BLLs to pre-designated concentrations believed to be "safe," is prohibited by OSHA. Non-traditional uses of chelation therapy are not advised. There is no established basis to initiate chelation based on results of hair analysis or, in most cases, urine lead levels nor for chelation of asymptomatic individuals with low blood lead concentrations. Chelation should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus. Breast feeding during chelation therapy is not recommended. The effect of chelating agents on the fetus and newborn is unknown.

### **Pregnancy and Breast Feeding Concerns**

Prevention of fetal and postnatal lead exposure of breastfed infants requires identification and control of sources of environmental and occupational lead exposures (both endogenous and exogenous) for pregnant and lactating women. The CDC has established 10 µg/dL (0.48 µmol/L) as a BLL of concern in children (CDC 2002).

Because fetal blood contains approximately 80% of the blood lead concentration of the mother, and because of the risk of spontaneous abortion, the panel's recommendation is that the mother's BLL should be kept below 5 µg/dL (0.24 µmol/L) from the time of conception through pregnancy. For women with a history of lead exposure, calcium supplementation during pregnancy may be especially important and may thus minimize release of lead from bone stores and subsequent fetal lead exposure.

In a recent prospective study, umbilical cord BLL and maternal bone lead measured shortly postpartum were independent risk factors for impaired mental development of the infants assessed at 24 months of age, even after controlling for contemporaneous BLL (Gomaa et al. 2002). Long-term prospective studies suggest that the adverse neurodevelopmental effects of prenatal lead exposure may not persist into adolescence if early postnatal exposure falls to background levels (Bellinger et al. 1990, 1992; Tong et al. 1996). However, maternal BLL measured during pregnancy has been associated with alterations in brainstem auditory response at in the offspring at age five (Rothenberg et al. 2000), and in retinal response at age 10 (Rothenberg et al. 2002b).

Lead does not concentrate in breast milk because it does not bind to nor dissolve in fat; thus, levels of lead are generally higher in a mother's blood than in her milk. Lead in human breast milk appears to be well-absorbed by breast fed infants. Nevertheless, breast feeding should be encouraged in most situations since the benefits generally outweigh the negatives. Decisions relating to lactating women with evidence of very high lead exposure should be made on an individual basis.

If elevated maternal blood lead is suspected or demonstrated, the source(s) of lead exposure in the mother's diet, home, and work environment should be identified and mitigated. Also, the clinician should monitor infant BLLs during the early weeks of breast feeding. Only upon detection and elimination of all other suspected lead sources without corresponding reduction of infant BLL should cessation of breast feeding be advised.

### **Retained Bullet**

Gunshot injuries to the head, face, and neck may be associated with swallowed bullets, fragments, or pellets, which result in a rapid increase in blood lead in the first days following injury. After detection of bullet fragments in the gut with X-rays, efforts to promote gastrointestinal decontamination may result in a gradual reduction of blood lead over the following weeks. Retained bullets or fragments, particularly those in joint spaces, are risk factors for elevated BLL after injury. Decisions to remove bullet fragments imbedded in tissue should be made in consultation between the treating physician and the surgeon. Individuals with retained bullets should receive baseline and periodic blood lead testing to monitor their lead status. Follow-up blood lead levels may not be needed if the bullets are in muscle tissue and physicians are sure the lead fragments have not migrated from muscle into tissues more likely to allow lead uptake.

## **CONCLUSIONS**

AOEC offers these Guidelines as a resource for health care providers, public health professionals, employers, and others to utilize in providing medical management of lead-exposed adults. In this document, the panel has summarized the current scientific evidence concerning the non-carcinogenic adverse health effects in adults from exposure to inorganic lead.

The toxic effects of lead can occur without overt symptoms. A substantial body of recent research demonstrates a high probability that lead exposure at levels previously thought to be of little concern can result in an increased risk of adverse chronic health effects if the exposure is maintained for many years, thereby resulting in a progressively larger cumulative dose. Such effects may include elevations in blood pressure and increased risk of hypertension, kidney disease, cognitive dysfunction and/or accelerated declines in cognitive function, and reproductive risks.

Prevention of lead exposure should remain the primary goal of health care providers, public health professionals, and employers. Biological monitoring, mainly by periodic measurement of blood lead levels (BLLs) for adults engaged in activity with potential exposure to lead, should be conducted routinely to assess the efficacy of primary prevention and to guide the clinician in determining whether exposure has become excessive. Clinicians are encouraged to advise patients of the risks associated with any elevation of lead level and to advocate strongly for environmental controls that would maintain BLLs below 10 µg/dL (0.48 µmol/L) wherever feasible.

**TABLE 1****Jobs and Industries with Potential Lead Exposure**

<i>General Industry</i>	
Lead production or smelting Brass, bronze, copper, or lead foundries Ammunition/explosives production Scrap metal handling Firing ranges Machining or grinding lead alloys Manufacture of radiation shielding Repair/replacement of refractory material in furnaces Ship building/repairing/breaking Mining	Battery manufacturing or recycling Automotive radiator repair Lead soldering Ceramic manufacturing Cable/wire stripping, splicing or production Rubber manufacturing Plastics manufacturing Leaded glass manufacturing Paint/pigment manufacturing
<i>Construction</i>	
Renovation, repair or demolition of structures with lead paint Welding or torch-cutting painted metal Sandblasting, sanding, scraping, burning, or disturbing lead paint	Use or disturbance of lead solder, sheeting, flashing, or old electrical conduit Plumbing, particularly in older buildings

**TABLE 2****Non-occupational and Environmental Sources of Lead Exposure**

Remodeling or painting pre-1978 housing	Lead solder in stained-glass artwork
Peeling paint	Lead-soldered cans
Ethnic medicines or folk remedies (e.g., azarcon, greta, pay-loo-ah, kandu, some Ayurvedics)	Lead-contaminated candies
Pica (ingestion of lead-containing nonfood items, e.g., soil or ceramics, plaster, or paint chips)	Backyard scrap metal recycling
Retained lead bullet or fragments	Moonshine (liquor from a homemade still)
Melting lead for fishing weights, bullets, or toys	Antique pewter plates, mugs, utensils, toys
Imported vinyl miniblinds	Imported brass or bronze kettles, cookware
Recreational target shooting	Lead-glazed tableware or cooking vessels
Lead-contaminated drinking water supply	Leaded crystal tableware
Using lead glazes for ceramics	Mine tailings
Painting/stripping cars, boats, bicycles	Beauty products such as kohl eye make-up, certain hair dyes

## ACKNOWLEDGEMENTS

These guidelines were adopted in May 2007 following approval by a three fourths majority of the AOEC member clinics. This version of the guidelines supercedes the prior version approved in December 2005.

AOEC wishes to acknowledge the authors of the final document: Rosemary Sokas, MD, MOH, Kathleen Fagan, MD, MPH, and Alan Ducatman, MD, MS.

While this paper does not necessarily reflect the views of the expert panel convened by AOEC in March 2003, AOEC also wishes to acknowledge their efforts. The final documents of the panel prepared for AOEC provided a significant contribution for this work.

Richard Wedeen, MD-CHAIR, Rose Goldman, MD, MPH, Dana Headapohl, MD, MPH, Karen Hipkins, RN, NP-C, MPH, Howard Hu, MD, MPH, ScD, Michael Kosnett, MD, MPH, Barbara Materna, PhD, CIH, Pamela Reich, BS, Stephen Rothenberg, PhD, Brian Schwartz, MD, MS, Eugene Shippen, MD, Laura Welch, MD, Alan Woolf, MD, MPH.

Affiliations and nominating organizations for the panelists and primary authors may be obtained from the AOEC office at 202-347-4976 or by e-mail from [kkirkland@aoec.org](mailto:kkirkland@aoec.org)

<b>8. When was your <u>first</u> doctor or prenatal care visit during this pregnancy?</b>	_____/_____/_____ Month      Day      Year	<input type="checkbox"/> Don't know
<b>8a. When is your <u>next</u> doctor or prenatal care appointment?</b>	_____/_____/_____ Month      Day      Year	<input type="checkbox"/> Not scheduled/ Don't have one
<b>8b. How far along are you in your pregnancy right now?</b>	_____(weeks)	<input type="checkbox"/> Don't know
<b>8c. What is your expected due date?</b>	_____/_____/_____ Month      Day      Year	<input type="checkbox"/> Don't know

**8d. Are you currently taking a prenatal vitamin with calcium?**
☐ No      ☐ Yes
**9. At which hospital do you plan to have your baby?**

Hospital Name:	
City/Borough:	State:
Comment:	<input type="checkbox"/> Don't know

**10. In the past, were you ever told you had a high blood lead level or were you diagnosed with lead poisoning?**

☐ No >> *go to Section D*      ☐ Yes >>      ☐ Don't know >> *go to Section D*

*If yes >>*

<b>10a. What was the blood lead level?</b>	_____ µg/dL <input type="checkbox"/> Don't know
<b>10b. When was the blood test taken?</b>	____/____/____ Mo Day Year <input type="checkbox"/> Don't know
<b>10c. In what city and state was the blood test performed?</b>	City: _____ State: _____ Country: _____
<b>10d. Were you pregnant at that time?</b>	<input type="checkbox"/> No <input type="checkbox"/> Yes

## D. DEMOGRAPHIC INFORMATION

Now, I'd like to learn more about your background.

**11. What is the highest grade or year of school you have completed?**

*Instructions: Read out the categories. Do not read out Declined to answer.*

<input type="checkbox"/> Never attended school or only attended kindergarten <input type="checkbox"/> Some elementary or primary school <input type="checkbox"/> Completed elementary or primary school <input type="checkbox"/> Some high school <input type="checkbox"/> Completed high school/ high school graduate <input type="checkbox"/> Some college or technical school <input type="checkbox"/> College graduate <input type="checkbox"/> Declined to answer
---

**12. Which of the following groups best describes your race or ethnicity? I'm going to first read out all the categories. You can tell me more than one category.**

*Instructions: Read out all categories first. Check as many as reported.*

<input type="checkbox"/> African American or Black <input type="checkbox"/> American Indian or Alaska Native <input type="checkbox"/> Asian <input type="checkbox"/> Hispanic or Latino <input type="checkbox"/> Native Hawaiian or Other Pacific Islander <input type="checkbox"/> White or Caucasian
<p><b><i>Instructions: Do not read aloud.</i></b></p> <p><input type="checkbox"/> Other group not listed, <i>Instructions: If mentioned, write in response.</i></p> <p>_____</p> <p><input type="checkbox"/> Declined to answer</p>

**E. COUNTRY OF BIRTH/ FOREIGN TRAVEL**

Now I have a few questions about where you were born and any trips you may have taken outside of the US. This information can help us identify possible ways you may have been exposed to lead. I am not interested in your immigration status.

13. In what country were <u>you</u> born?	<input type="checkbox"/> U.S. >> go to Q.14 <input type="checkbox"/> Mexico <input type="checkbox"/> Bangladesh <input type="checkbox"/> Ecuador <input type="checkbox"/> India <input type="checkbox"/> Pakistan <input type="checkbox"/> Other country: _____ <input type="checkbox"/> Declined to answer
---	--

*Instructions: If woman was born in **Bangladesh, Ecuador, India, Mexico, or Pakistan** show list at the end of the form (Appendix A).*

**13a. Where in [Bangladesh, Ecuador, India, Mexico, or Pakistan] were you born?**

Bangladesh: \_\_\_\_\_

Ecuador: \_\_\_\_\_

India: \_\_\_\_\_

Mexico: \_\_\_\_\_

Pakistan: \_\_\_\_\_

☐ Don't know >> go to Q. 13b

***Instructions: For ALL women born outside of the US.***

13b. How long did you live there?	_____ day(s) _____ month(s) _____ year(s)
13c. When (what month and year) did you come to the US?	Month: _____ Year: _____

***Instructions: For all women, including US-born women.***

*For foreign-born women – read first part of sentence. For US-born, start from 2<sup>nd</sup> line:*

**14. Since leaving [birth country],**

**Have you ever spent any time outside of the US? This includes any traveling, visiting family or friends, or living in another country.**

☐ No >> go to Section F    ☐ Yes >>

**14a.** *If yes >> Instructions: Write down all information about time spent outside of US. Ask for all visits. If more than 3 times, write below.*

	#1	#2	#3
<b>Country</b>			
<b>When did you stay there?</b> (start w/ most recent)	____/____ Mo/Year	____/____ Mo/Year	____/____ Mo/Year
<b>How long did you stay?</b>	<input type="checkbox"/> Less than 1 month <input type="checkbox"/> More than 1 month <input type="checkbox"/> Don't know	<input type="checkbox"/> Less than 1 month <input type="checkbox"/> More than 1 month <input type="checkbox"/> Don't know	<input type="checkbox"/> Less than 1 month <input type="checkbox"/> More than 1 month <input type="checkbox"/> Don't know
<b>How often do you travel there?</b>	<input type="checkbox"/> 1x a year <input type="checkbox"/> every 2 years <input type="checkbox"/> every 5 years	<input type="checkbox"/> 1x a year <input type="checkbox"/> every 2 years <input type="checkbox"/> every 5 year	<input type="checkbox"/> 1x a year <input type="checkbox"/> every 2 years <input type="checkbox"/> every 5 years
<b>Comments</b>			

## F. IMPORTED REMEDIES, FOODS, SPICES, COSMETICS AND POTTERY

Now I am going to ask you about some product(s) you may have used or come in contact with, such as medications and health remedies, foods and spices. Some of these products may be made in other countries and may contain lead. They could be products or items:

- sent by friends and family
- brought back from trips you may have taken
- bought in local stores
- or given to you by friends or family

**I want to find out if you used any of these products during the past 12 months.**

*Instructions: Ask woman to show you products in the kitchen and medicine cabinets. Take note of any product(s) that may contain lead. If Yes to Questions 15 – 18, ask to see product(s). See sampling guidelines. Complete Non-Dust Chain of Custody Form.*

**15. [Imported Medicines] Have you used any imported...**

Product	No	Yes >>	Sample Taken (Yes/No)	Comments/Observations
Medicines? (e.g. Products to help become pregnant or remedies for stomach problems)			Yes / No	
Ayurvedics? (e.g. Remedies based on traditional Indian medical system)			Yes / No	
Vitamins?			Yes / No	
Powder or pills?			Yes / No	
Herbs?			Yes / No	
Teas?			Yes / No	
Any other imported remedies?: _____			Yes / No	

**16. [Imported Cosmetics] Have you used any imported...**

Product	No	Yes >>	Sample Taken (Yes/No)	Comments/Observations
Cosmetics? (e.g. Eye makeup, hair dye)			Yes / No	
Deodorant?			Yes / No	
Any other imported cosmetics?: _____			Yes / No	

**17. [Imported Food] Have you eaten any imported...**

Product	No	Yes >>	Sample Taken (Yes/No)	Comments/Observations
Spices? (e.g. Orange or red spices)			Yes / No	
Foods?			Yes / No	
Snacks or candies? (e.g. Candy spiced with chili or sold in clay pots)			Yes / No	
Any other imported food?: _____			Yes / No	

**18. [Imported Pottery] Have you been served food in or eaten from imported, antique or painted...**

Product	No	Yes >>	Sample Taken (Yes/No)	Comments/Observations
Clay pots?			Yes / No	
Ceramic dishes, bowls, pitchers, or cups?			Yes / No	
Any other imported containers?: _____			Yes / No	

## G. NON-FOOD ITEMS

Now I'd like to ask you about your eating habits during your pregnancy. Women often crave or have an urge to eat many different things when pregnant. Some women eat new foods when they are pregnant; some eat things that are recommended during pregnancy by family and friends; and some women also eat things that are not considered food.

19. At any time during your pregnancy, have you eaten, chewed on or mouthed anything that is not food? Some examples are paint chips, soil, clay, crushed pottery or other items.

☐ No >> go to Section H    ☐ Yes >>

19a. If yes >> Instructions: Write in information in table.

	#1	#2	#3
Item Name/Description			
Where did you get it?			
For how long have you been eating it?	_____ wks/mo/yrs	_____ wks/mo/yrs	_____ wks/mo/yrs
How <u>often</u> do/did you eat, on average? (daily, weekly, monthly)			
How <u>much</u> do you eat, on average?			
Why did you eat it?			
Sample Taken	No / Yes	No / Yes	No / Yes
Comments/Observations			

Instructions: See sampling guidelines and complete Non-Dust Chain of Custody Form.

## H. OCCUPATION AND HOBBIES

Now I'd like to ask you about the jobs, hobbies or activities of people in the household.

20. Are you currently working?

<input type="checkbox"/> Yes >>	20a. Please describe the work you do.	
<input type="checkbox"/> No >>	20b. Have you worked in the past?	
	<input type="checkbox"/> No <input type="checkbox"/> Yes >> 20c. Please describe your past work: _____	

**21. Have you or anyone in your household done any of the following jobs, hobbies or activities?**

<b>Job/hobby/activity</b>	<b>No Yes</b>	<b>Relationship to PW</b>	<b>Time Period/ How long? (mo/yrs)</b>	<b>Comment Section/ Current Status</b>
Bridge painting or repair work	<input type="checkbox"/> No <input type="checkbox"/> Yes	<input type="checkbox"/> Self <input type="checkbox"/> Other: _____	_____ month(s) _____ year(s)	
Commercial building renovation or demolition	<input type="checkbox"/> No <input type="checkbox"/> Yes	<input type="checkbox"/> Self <input type="checkbox"/> Other: _____	_____ month(s) _____ year(s)	
Home renovation, repair or repainting	<input type="checkbox"/> No <input type="checkbox"/> Yes	<input type="checkbox"/> Self <input type="checkbox"/> Other: _____	_____ month(s) _____ year(s)	
Torch cutting or burning steel, welding	<input type="checkbox"/> No <input type="checkbox"/> Yes	<input type="checkbox"/> Self <input type="checkbox"/> Other: _____	_____ month(s) _____ year(s)	
Cable splicing, soldering, electronics repair	<input type="checkbox"/> No <input type="checkbox"/> Yes	<input type="checkbox"/> Self <input type="checkbox"/> Other: _____	_____ month(s) _____ year(s)	
Metal or car battery recycling; working in a scrap yard; radiator repair	<input type="checkbox"/> No <input type="checkbox"/> Yes	<input type="checkbox"/> Self <input type="checkbox"/> Other: _____	_____ month(s) _____ year(s)	
Working in a firing range; target shooting	<input type="checkbox"/> No <input type="checkbox"/> Yes	<input type="checkbox"/> Self <input type="checkbox"/> Other: _____	_____ month(s) _____ year(s)	
Jobs/Crafts like furniture refinishing, jewelry making, stained glass, pottery, ceramics, glass blowing; making fishing weights, bullets, or lead figures	<input type="checkbox"/> No <input type="checkbox"/> Yes	<input type="checkbox"/> Self <input type="checkbox"/> Other: _____	_____ month(s) _____ year(s)	
Other: _____	<input type="checkbox"/> No <input type="checkbox"/> Yes	<input type="checkbox"/> Self <input type="checkbox"/> Other: _____	_____ month(s) _____ year(s)	

**I. PAINT HAZARDS**

**22. In the past 12 months, has there been water damage, deteriorated plaster or paint in this home?**

☐ No >> go to Q.23    ☐ Yes >>    ☐ Don't know >> go to Q.23

**22a. If yes >> Can you please show me and describe the damage?**

<b>Location/Room</b>	
<b>Describe Damage</b>	
<b>When did this occur? (mo/yr)</b>	____/____ Mo/Year
<b>Current Status</b>	

**23. In the past 12 months, has there been any renovation or repair work at your current address, at an address where you lived previously or another address where you have spent time?**

☐ No >> go to Q.24    ☐ Yes >>    ☐ Don't know >> go to Q.24

**23a. If yes>> Please tell me what type of work and when the work was done.**

	<b>#1</b>	<b>#2</b>
<b>Location/Room</b>		
<b>Work Description</b>		
<b>Address</b>		
<b>When was the work done? (mo/yr)</b>	____/____ Mo/Year	____/____ Mo/Year
<b>Current Status</b>		

**24. Do you plan to stay at this current address after your baby is born?**

☐ No    ☐ Yes    ☐ Don't know

**J. ALTERNATE CONTACT**

Finally, I would like to ask for a contact person in case we cannot reach you.

25. Is there another person, like a family member or friend, who lives at a different address, whom we could contact?

☐ No >> go to Q. 26      ☐ Yes >>

25a. What is this person's relationship to you?

☐ Husband   ☐ Boyfriend   ☐ Mother   ☐ Father   ☐ Brother   ☐ Sister   ☐ Aunt  
☐ Uncle   ☐ Grandmother   ☐ Grandfather   ☐ Other: \_\_\_\_\_

25b. Please tell me his/her name and telephone number?

Alternate contact's last name			
Alternate contact's first name			
Home number	(____) _____ - _____	<input type="checkbox"/> Not provided	
Work number	(____) _____ - _____	<input type="checkbox"/> Not provided	
Cell number	(____) _____ - _____	<input type="checkbox"/> Not provided	

*Instructions: Inform woman that she should notify alternate contact that we may contact him/her but only if we cannot get in touch with her.*

26. Is there anything else you would like to tell me?

*Instructions: Ask if there are any questions.*

<input type="checkbox"/> No	<input type="checkbox"/> Yes >> _____
	_____
	_____

Time Ended: \_\_\_\_\_

**Visual Inspection**

Now I need to look around your home for possible sources of lead exposure. I may need to take some samples. The results of the tests will be provided to you as soon as they are available.

*Instructions: Conduct visual inspection.*

**SUMMARY**

*Instructions: Check all those that apply. Then, ask if there are any questions.*

**Potential Lead Exposure****Yes    No**

## **Counseling and Education**

### **Follow up with your doctor**

- How often you will need a blood lead test is based on the results of your previous blood tests as well as your risk for further exposure.
- Discuss breastfeeding with your doctor. Breastfeeding is generally considered safe in most cases.

### **Eat a healthy diet during pregnancy**

- It is important to eat foods with enough calcium, iron and vitamin C.
- Talk to your doctor to make sure you are getting enough of these nutrients. Your doctor may suggest changes to your diet or may prescribe a supplement to help you get enough of these nutrients.

### **Reduce your exposure to lead**

- Avoid using medicines, spices, foods or cosmetics from other countries. They are more likely to contain lead than products made in the United States.
- Avoid using clay pots and dishes from other countries to cook, store or serve food. Do not use pottery that is chipped or cracked.
- Never eat non-food items such as clay, soil, pottery or paint chips.
- Stay away from any repair work being done in your home.
- Avoid jobs and hobbies that may involve contact with lead.

### **Get other household members tested for lead**

- This is especially important for children younger than 6 years of age, children with developmental problems and pregnant women.
- Older children and adults should be tested if they may have had contact with lead.

### **For more information about lead poisoning**

- Speak with your doctor.
- You can contact me at 212-676-6379.
- Call 311 and ask for the BAN-LEAD information line.
- Go to [www.nyc.gov/lead](http://www.nyc.gov/lead).

***Ask if there are any questions.***

**APPENDIX A: Question 13a.**

*Instructions: Please show this list to the woman and ask her to tell you/point to the area where she was born. Then return to Q.13a on page 6 and write in name of area. If the area is not on the list, please write in the area and ask for the spelling.*

**Appendix IX**  
Assessment Interview Form  
Minnesota Department of Health

## RISK ASSESSMENT INTERVIEW FORM

Date: \_\_\_\_\_ Case #: \_\_\_\_\_

Child's Name: \_\_\_\_\_ Date of Birth: \_\_\_\_\_

Parent's Name(s): \_\_\_\_\_ Person interviewed: \_\_\_\_\_

Address: \_\_\_\_\_

Phone # (include area code): \_\_\_\_\_

1. Are there any other children under the age of six? Yes \_\_\_\_\_ No \_\_\_\_\_

Names: \_\_\_\_\_  
\_\_\_\_\_

Have they been tested for lead? Yes \_\_\_\_\_ No \_\_\_\_\_

2. How long have you lived at this address? \_\_\_\_\_ Own \_\_\_\_\_ Rent \_\_\_\_\_

Year built: \_\_\_\_\_

If rented, landlord's name, address and phone number: \_\_\_\_\_  
\_\_\_\_\_

If less than 12 months, list previous address for past 12 months: \_\_\_\_\_  
\_\_\_\_\_

3. Has any renovation of the residence taken place within the past year? Any furniture renovation? Please specify:

\_\_\_\_\_  
\_\_\_\_\_

4. Does child spend several hours each week in another location such as a day care facility, grandparent's home, babysitter's home, playgrounds, neighbor's home, other neighborhood areas? If so, what are those addresses?:

1. \_\_\_\_\_ Average time each week: \_\_\_\_\_ hrs.  
2. \_\_\_\_\_ Average time each week: \_\_\_\_\_ hrs.

5. Occupations of adults in household: \_\_\_\_\_

6. Are there pets living at the residence that are allowed outdoors? Yes \_\_\_\_\_ No \_\_\_\_\_

7. Are there areas of bare soil near the residence? Yes \_\_\_\_ No \_\_\_\_

Is there a sand box or play area near a street or alley, or next to the house or garage? Yes \_\_\_\_ No \_\_\_\_

8. Is car repair done at the residence? Where? \_\_\_\_\_

9. Note the condition of the surrounding neighborhood. Are there areas of potential lead exposure?

\_\_\_\_\_  
\_\_\_\_\_

10. Where does the child play inside and outside the residence? \_\_\_\_\_

\_\_\_\_\_

Where does the child like to hide? \_\_\_\_\_

11. Has the child been given folk medicines such as:

Greta (Hispanic) \_\_\_\_ Azarcon (Hispanic) \_\_\_\_ Surman (Asian) \_\_\_\_ Pay-loo-ah(Hmong) \_\_\_\_

12. Does the child have contact with or access to:

car batteries<sup>1</sup> \_\_\_\_\_

solder<sup>2</sup> \_\_\_\_\_

lead sinkers or other fishing  
supplies \_\_\_\_\_

stained glass<sup>3</sup> \_\_\_\_\_

pesticides<sup>4</sup> \_\_\_\_\_

painted, antique or foreign toys<sup>5</sup> \_\_\_\_\_

pool cue chalk<sup>6</sup> \_\_\_\_\_

colored newsprint<sup>7</sup> \_\_\_\_\_

bullets, gunshot or reloads<sup>8</sup> \_\_\_\_\_

pewter items<sup>9</sup> \_\_\_\_\_

ceramic dishes or food  
containers<sup>11</sup> \_\_\_\_\_

paint, varnish or supplies<sup>10</sup> \_\_\_\_\_

13. Does the child:

suck the thumb \_\_\_\_\_

put fingers in mouth \_\_\_\_\_

eat paint chips \_\_\_\_\_

pick at paint \_\_\_\_\_

eat soil/mud pies \_\_\_\_\_

eat crayons \_\_\_\_\_

chew/suck on matches \_\_\_\_\_

chew/suck on furniture \_\_\_\_\_

chew/suck on miniblinds \_\_\_\_\_

spend time at windows \_\_\_\_\_

chew/suck on windowsills or  
sashes \_\_\_\_\_

14. Where do parents think lead exposure is occurring? \_\_\_\_\_

\_\_\_\_\_

*Foot Note:*

1. Car batteries are made of lead.

2. Solder used for electrical or plumbing work may contain lead.

3. Lead solder is typically used to hold the stained glass together at the seams.

4. Some older pesticides may contain lead arsenate, usually in powder form.

5. Antique toys or those produced in another country may have lead paint.

6. Some brands of green pool cue chalk may contain lead.

7. Colored newsprint, more likely glossy print, may be printed with ink containing lead.

8. Bullets and shot used for reloading are made of lead and the dust from reloading may also be a hazard.

9. Pewter contains lead.

10. Old paint and varnish may contain lead.

11. Paint and glaze used on ceramics and pottery may contain lead.

Lead Based Paint Risk Assessment Form  
Minnesota Department of Health

# Lead-Based Paint Risk Assessment Report

for the Property located at

[ADDRESS]  
[CITY, Minnesota, ZIP]

Conducted by

[RA signature on line (*delete this*)]

---

[RISK ASSESSOR'S NAME], [LICENSE NUMBER (LR####)]

Minnesota Department of Health

[ADDRESS]  
[CITY, Minnesota, ZIP]  
[PHONE]

[REPORT DATE]

# LEAD RISK ASSESSMENT REPORT

[ADDRESS]

[CITY, MINNESOTA, ZIP]

Case: [CASE NUMBER]

## I. AUTHORITY

Minnesota Statutes 144.9504, subdivision 2, sub-subdivision (a) requires the Minnesota Department of Health (MDH) to conduct a lead risk assessment on a property according to the venous blood lead level of a child or pregnant female residing at the property.

## II. BACKGROUND

*(Pick one of the following paragraphs, delete the rest)*

MDH conducted a lead risk assessment at the property located at [ADDRESS] in [CITY], Minnesota, on [DATE OF RISK ASSESSMENT]. The property was constructed in [YEAR] and is owned by [PROPERTY OWNER NAME, PROPERTY OWNER ADDRESS, PROPERTY OWNER CITY, STATE, ZIP, PHONE NUMBER].

*(If unable to determine the year of construction)*

MDH conducted a lead risk assessment at the property located at [ADDRESS] in [CITY], Minnesota, on [DATE OF RISK ASSESSMENT]. MDH was unable to determine the year of construction. The property is owned by [PROPERTY OWNER NAME, PROPERTY OWNER ADDRESS, PROPERTY OWNER CITY, STATE, ZIP, PHONE NUMBER].

*(If unable to determine the year of construction or the phone number of the property owner)*

MDH conducted a lead risk assessment at the property located at [ADDRESS] in [CITY], Minnesota, on [DATE OF RISK ASSESSMENT]. MDH was unable to determine the year of construction. The property is owned by [PROPERTY OWNER NAME, PROPERTY OWNER ADDRESS, PROPERTY OWNER CITY, STATE, ZIP]. MDH was unable to determine the phone number of the property owner.]

## III. FINDINGS

MDH observed deteriorated lead-based paint in these areas: [LIST OUT ROOMS OR AREAS].

- Kitchen
- Child's bedroom
- Parent's bedroom
- Bare soil on west side of house

(Use one of the following sentences: MDH did not observe any dust or debris in the property. OR MDH observed dust and debris in the following areas [THEN LIST OUT ROOMS OR AREAS]:

- Child's bedroom
- Parent's bedroom

#### IV. METHODS

The lead risk assessment was conducted with an x-ray fluorescence (XRF) analyzer, dust wipe sampling [and soil sampling]. MDH used a [BRAND AND MODEL] XRF (Serial #####) to analyze painted surfaces. The specific testing locations are located in Appendix A. Analytical results from the XRF testing are located in Appendix B. Dust wipe samples [and soil samples] were collected and sent to [LAB NAME, LAB ADDRESS, LAB CITY, LAB STATE, LAB PHONE NUMBER, (EPA ID#)] for analysis. The analytical results of the dust wipe samples [and soil samples] are located in Appendix C. *(If snow cover prevents soil sampling, delete soil sampling from the paragraph and add this sentence: Due to snow cover, soil sampling was unable to be completed at this time, but will be done as soon as conditions allow. An amended report will be issued with the soil sampling results.)*

#### V. DISCLOSURE REQUIREMENT

Code of Federal Regulations, title 24, section 35.88, and title 40, section 745.107, requires that a copy or a summary of the lead risk assessment report be provided to current lessees and future tenants if renting the property; or to the purchaser of the property at the time of sale of this property.

#### VI. RECOMMENDATIONS

The following table identifies the location, type and severity of lead hazards observed at the property. They are prioritized with the items at the top of the table having the most immediate health impact while those near the bottom of the table will impact health to a lesser extent.

Lead Hazards			
<u>Location</u>	<u>Component</u>	<u>Color</u>	<u>Severity</u>
Child's Bedroom	All Windows	Blue	Poor
Parent's Bedroom	Closet Door	Brown	Poor
Living Room	All Windows	White	Poor
Kitchen	Door Casing	Green	Poor
Front Porch	Floor	Red	Poor
Front Porch	Railing	Red	Poor
Rear Porch	Railing	Red	Poor
Back Yard	Bare Soil	N/A	Poor
Parent's Bedroom	All Windows	White	Intact

Kitchen	Window Sash by Sink	White	Intact
Rear Porch	Car Batteries	N/A	Intact

*(Expand or contract the table as necessary. Keep the severity at intact or poor.)*

Areas where lead hazards are identified should be washed with a household detergent and rinsed with clean rinse water.

Paint identified in poor condition is a lead hazard. Options to reduce lead hazards on sound or non-rotting components include, but are not limited to:

- Wet scraping and repainting
- On- or off-site paint stripping
- On- or off-site component planing
- Covering with an impermeable material, such as vinyl or aluminum coil stock
- Component replacement

Options to reduce lead hazards on unsound or rotting components include, but are not limited to:

- Component repair
- Component replacement

*(If bare soil is a lead hazard, use the following sentence. If no bare soil was observed, delete it)*

Bare soil may be covered with sod, wood chips, sand or other non-living material after all visible paint chips are removed from the bare soil area.

[LIST OUT ANY OTHER UNUSUAL COMPONENTS AND RECOMMENDATIONS FOR THEM i.e. The car batteries on the rear porch should be removed to an area where they are inaccessible to the child.]

# Appendix A

## Testing Locations

# Appendix B

## XRF Testing Results

### Paint Standard

$\geq 1.0$  milligram per square centimeter ( $\geq 1.0 \text{ mg/cm}^2$ )

If a paint sample equals or exceeds the standard, it is considered a lead hazard.

### Explanation of Column Headings

*(The following items will have to be edited depending on what the XRF print-out looks like)*

XRF# - Machine generated sequence number

Insp/XRF – Initials of the inspector and the serial number of the machine

Floor – Floor level

Wall – Wall side of the room starting with A on the street side and going clockwise

Room – Room being tested

Structure (and Feature) – What is being tested

Substrate – The composition of the tested component

Condition – Condition of the paint

Color – Color of the paint

DI – Depth Index – the larger the number the deeper the lead-based paint layer

Result – The result of the test

PbC – The total combined lead in the layers of paint

PbC Error – The error of the total combined lead level

# Appendix C

## Dust Wipe and Soil Sample Results

### Dust Wipe Standards

Floor Wipe – 40 micrograms per square foot ( $\mu\text{g}/\text{ft}^2$ )

Window Sill – 250  $\mu\text{g}/\text{ft}^2$

Window Well – 400  $\mu\text{g}/\text{ft}^2$

If a dust wipe sample equals or exceeds the standard, it is considered a lead hazard.

See the attached City of Minneapolis Public Health Laboratory Chain of Custody Form for sampling results.

*(If soil samples were not collected, delete this)*

### Soil Standard

100 parts per million (ppm)

If a soil sample equals or exceeds the standard, it is considered a lead hazard.

See the attached City of Minneapolis Public Health Lab Chain of Custody Form for sampling results.

**G. COUNSELING AND EDUCATION****Follow up with your child's doctor**

- ☐ Blood lead tests are necessary to monitor your child's exposure to lead. How often these tests need to be done depends on your child's lead level, length of exposure and risk for further exposure.
- ☐ Generally, the higher the blood lead level and the longer the exposure, the more time it will take for the lead to leave your child's body, and the longer your child will need to be monitored by your doctor.

**Reduce your child's exposure to lead**

- ☐ Keep your child away from the lead paint hazards noted in your home. Consider having your child stay somewhere else while hazards are being corrected.
- ☐ Wash floors and windowsills often using a damp mop or damp cloth.
- ☐ Wash your child's hands, toys, pacifiers and bottles often to remove lead dust, especially before your child eats or sleeps.
- ☐ If someone in your home has a job or hobby that involves contact with lead, have them remove their shoes before entering your home. Wash their work clothes separately from family laundry.
- ☐ Avoid using medicines, spices, foods, cosmetics, jewelry, and painted toys from other countries. They are more likely to contain lead than products made in the U.S.A.
- ☐ Avoid using clay pots and dishes from other countries to cook, store or serve food. Do not use pottery that is chipped or cracked.
- ☐ Do not let your child eat or mouth non-food items that may contain lead or lead dust.
- ☐ Use cold tap water only for making baby formula or baby cereal, and for drinking or cooking. Let water run for a few minutes before you use it. Lead can get into water through old plumbing.

**Help your child to eat healthy**

- ☐ It is important for your child to eat a healthy diet with enough calcium, iron and vitamin C.
- ☐ Talk to your doctor to make sure your child is eating foods with enough calcium, iron, and vitamin C in them.

**Get other household members tested for lead**

- ☐ This is especially important for children younger than 6 years of age, children with developmental problems and pregnant women.
- ☐ Older children and adults should be tested if they may have had contact with lead.

**For more information about lead poisoning**

- ☐ Speak with your doctor  
Contact your case coordinator at 212-676-6379
- ☐ Call 311 and ask for the BAN-LEAD information line
- ☐ Go to [www.nyc.gov/lead](http://www.nyc.gov/lead)

**Provide information packet. Ask if there are any questions.**

|  | <input type="checkbox"/> Other: _____ |

**N. COUNSELING AND EDUCATION**

**Follow up with your child's doctor**

- ☐ Blood lead tests are necessary to monitor your child's exposure to lead. How often these tests need to be done depends on your child's lead level, length of exposure and risk for further exposure.
- ☐ Generally, the higher the blood lead level and the longer the exposure, the more time it will take for the lead to leave your child's body, and the longer your child will need to be monitored by your doctor.

**Reduce your child's exposure to lead**

- ☐ Keep your child away from the lead paint hazards noted in your home. Consider having your child stay somewhere else while hazards are being corrected.
- ☐ Wash floors and windowsills often using a damp mop or damp cloth.
- ☐ Wash your child's hands, toys, pacifiers and bottles often to remove lead dust, especially before your child eats or sleeps.
- ☐ If someone in your home has a job or hobby that involves contact with lead, have them remove their shoes before entering your home. Wash their work clothes separately from family laundry.
- ☐ Avoid using medicines, spices, foods, cosmetics, jewelry, and painted toys from other countries. They are more likely to contain lead than products made in the U.S.A.
- ☐ Avoid using clay pots and dishes from other countries to cook, store or serve food. Do not use pottery that is chipped or cracked.

- ☐ Do not let your child eat or mouth non-food items that may contain lead or lead dust.
- ☐ Use cold tap water only for making baby formula or baby cereal, and for drinking or cooking. Let water run for a few minutes before you use it. Lead can get into water through old plumbing.

**Help your child to eat healthy**

- ☐ It is important for your child to eat a healthy diet with enough calcium, iron and vitamin C.
- ☐ Talk to your doctor to make sure your child is eating foods with enough calcium, iron, and vitamin C in them.

**Get your household members tested for lead**

- ☐ This is especially important for children younger than 6 years of age, children with developmental problems and pregnant women.
- ☐ Older children and adults should be tested if they may have had contact with lead.

**For more information about lead poisoning**

- ☐ Speak with your doctor
- ☐ Call 311 and ask for the BAN-LEAD information line
- ☐ Contact your case manager at 212-676-6379
- ☐ Go to [www.nyc.gov/lead](http://www.nyc.gov/lead)

*Ask if there are any questions.*

**APPENDIX A: Questions 11a.** Instructions: Please show this list to parent/guardian and ask him/her to tell you/point to the area where the child was born. If the area is not on the list, please write in the area and ask for the spelling.

**Appendix XIII**  
Nutritional Reference Information

## Nutrition Reference Information

### RECOMMENDED INTAKE AND COMMON FOOD SOURCES

The Dietary Reference Intakes are nutrient reference values established by the Food and Nutrition Board of the National Academy of Sciences' Institute of Medicine (IOM 1997, 2000, 2001). Reference values are population specific and vary by sex and life cycle group and during pregnancy or lactation. The type of reference values established differ based on the quantity and quality of the research used to establish recommendations. The Recommended Dietary Allowance (RDA) is the nutrient intake level that is used as a goal for an individual and represents an intake level which is sufficient to meet the nutrient requirements of nearly all healthy individuals in the population (IOM 1997, 2000, 2001). If insufficient clinical data is available to establish an RDA, an Adequate Intake (AI) is established. The AI is a level that is felt to meet the needs of all individuals in the group (IOM 1997, 2000, 2001). Pregnant and lactating women should aim to meet established RDA or AI levels for through dietary intake. Vitamin or mineral supplementation is recommended for those women who are unable to meet nutrient requirements through dietary sources.

#### **Calcium**

The Adequate Intake level of calcium is 1,300 mg/day for pregnant and lactating women 18 years and younger and 1,000 mg/day for pregnant and lactating women 19 years and older (IOM 1997). The richest and most absorbable sources of calcium are dairy products including: milk, cheese, and yogurt. However, many ethnic groups avoid dairy products because of lactose intolerance which has been estimated to have a high prevalence in Asians (100%), African Americans (75%), Native Americans (100%), and Hispanics (53%)(Jackson and Savaiano, 2001). Calcium-set tofu and calcium-fortified fluids such as orange juice, soymilk, almond milk, and rice milk, are also rich sources of calcium. Calcium is also found in some vegetables such as broccoli, bok choy, and kale; however, the calcium found in plant foods is less bioavailable than the calcium in dairy products and fortified foods.

#### **Iron**

The Recommended Dietary Allowance of iron is 27 mg/day for all pregnant women, 10 mg/day for lactating women 18 years and younger, and 9 mg/day for lactating women 19 years and older (IOM 2001). The amount of iron from food that is absorbed by the body is dependent on the source of the iron. Heme iron is readily absorbed by the body and is found in meat, poultry, and fish. Nonheme iron is found in iron-fortified foods such as bread, cereal, and grain products, beans/legumes, vegetables, and iron supplements. The absorption of nonheme iron is enhanced when eaten at the same time as vitamin C rich foods or with an animal product such as meat or poultry.

#### **Selenium**

The Recommended Dietary Allowance of Selenium is 60 µg/day for all pregnant women and 70 µg/day for all lactating women (IOM 2000). Selenium is found in: meats, especially organ meats, seafood, and Brazil nuts. The selenium content of fruits, vegetables, nuts, and grains is dependent on soil selenium content and therefore varies substantially based on the plant's origin.

#### **Zinc**

The Recommended Dietary Allowance of zinc is 12 mg/day for pregnant and 13 mg/day for lactating women 18 years and younger and 11 mg/day for pregnant and 12 mg/day lactating women 19 years and older (IOM 2001). Red meat and shellfish are rich sources of bioavailable zinc. Zinc is also found in: nuts, legumes, fortified cereals, and whole grains.

### **Vitamin C**

The Recommended Dietary Allowance of vitamin C is 80 mg/day for pregnant and 115 mg/day for lactating women 18 years and younger and 85 mg/day for pregnant and 120 mg/day for lactating women 19 years and older (IOM 2000). Vitamin C is found in: plant products such as citrus fruits, fruit juice, tomatoes, tomato juice, potatoes, cauliflower, broccoli, strawberries, cabbage and spinach.

### **Vitamin D**

The Recommended Dietary Allowance of vitamin D is 200 IU/day for all pregnant and lactating women (IOM 1997). Recommendations for higher dietary intakes of pre-formed vitamin D have also been made (Prentice 2003; Hollis 2005). In nonpregnant adults, daily supplementation with 400 IU vitamin D increases 25(OH)D by 7.0 nmol/L (2.8 ng/ml) (Heaney). Supplementation of a pregnant woman with 400 IU vitamin D, as in prenatal vitamins, has little effect on her 25(OH)D concentration (Wagner 2008). The AAP recommends that pregnant women maintain a 25(OH)D level of  $\geq 80$  nmol/L (32 ng/ml) (Wagner 2008). Dark-skinned individuals require exposures about 5-10 times as long as light-skinned individuals to achieve similar levels of cutaneous vitamin D production. (Holick 2004). At latitudes above 35°N and below 35°S ultraviolet B photons do not penetrate of the earth's surface in winter months, making cutaneous vitamin D production negligible in those months; additionally sun exposures outside the peak sun hours of 10 AM to 3 PM in the spring, summer and fall has limited impact on cutaneous vitamin D synthesis (Holick 2003). Clinicians should note that obesity is a risk factor for low 25(OH)D and that sunscreen blocks cutaneous production of vitamin D (Holick 2007). The AAP recommends that exclusively and partially breastfed infants receive supplements of 400 IU/day of vitamin D shortly after birth and continue to receive these supplements until they are weaned and consume  $\geq 1,000$  mL/day of vitamin D-fortified formula or vitamin D-fortified milk (Wagner).

Food sources of vitamin D (25-hydroxy vitamin D) include: fortified milk, fortified orange juice, fortified cereal, some fatty fish (such as salmon and sardines), fish liver oils, and some eggs. UV radiation exposure stimulates vitamin D synthesis (through activation of the pro-vitamin D precursor 7-dehydrocholesterol present in skin), so vitamin D needs can also be met through sun exposure though dark-skinned women require more time exposed to sunlight for the same benefits and, thus, more vitamin D to be obtained from the diet (Holick, 2004).

In the United States 98% of fluid milk is estimated to be fortified with vitamin D (Anderson and Toverud, 1994), however, one study found that only 47.7% of milk samples were appropriately fortified with most of the out-of-compliance milk samples being under-fortified (Murphy et al., 2001). In 2003, the Food and Drug Administration approved food fortification with vitamin D of calcium-fortified juices and juice drinks (FDA, 2003). This may provide enhanced sources of dietary vitamin D to ethnic groups who avoid dairy products because of lactose intolerance. Strategies to increase vitamin D intake, especially for non-Caucasians, emphasize dietary supplements and these vitamin-D enriched non-dairy products.

### **Vitamin E**

The Recommended Dietary Allowance of vitamin E is 15 mg (22.5 IU)/day for all pregnant women and 19 mg (28.5)/day for all lactating women (IOM 2000). Foods rich in vitamin E include: vegetable oils (olive, sunflower, and safflower oils), nuts, whole grains, green leafy vegetables, and meats.

## **ASSESSMENT OF NUTRIENT STATUS AND INTAKE**

### **Biochemical Indicators**

Blood hemoglobin levels are routinely measured to screen for iron deficiency anemia (IOM 2001) and serum concentration of 25(OH)D is the best indicator of vitamin D status (IOM 1997). Biochemical assessment of nutrient status is not routinely performed for all vitamins and minerals, however, because reliable and valid laboratory tests of nutritional status are not available for many nutrients such as zinc and calcium (reference needed).

In the absence of biochemical assessment options, dietary assessment methods are utilized to estimate usual dietary intake and to screen for possible dietary inadequacies. The most commonly used dietary assessment methods include: 24-hour recalls, food (diary) records, and food frequency questionnaires.

### ***24-Hour Recall***

During a 24-hour recall, an individual is asked to report food and fluid intake information for the previous day (Hu 2008). The individual is probed for additional information about the food or beverage consumed, including preparation the portion size eaten. A brief qualitative assessment of the recall is usually conducted by the clinician performing the assessment. Common qualitative assessments conducted include: estimation of the number of servings of fruits/vegetables eaten or for the inclusion so of iron-rich or calcium-rich foods. The 24-hour recall is the dietary assessment method most commonly utilized in clinical settings because they can be conducted in a short amount of time and they do not require advanced preparation or complicated scoring. Limitations of the 24-hour recall include: reliance on memory, difficulty in estimation of portion sizes, underreporting of food intake, and intentional omission of nutrient-poor foods. In addition, food consumed in the previous day may also not be representative of usual dietary intake.

### ***Food Record***

The food record (diary) method requires that an individual record in detail all the foods and beverages consumed over one or more days (typically between 3 and 7 days) (Hu 2008). The individual completing the food record is typically taught about recording procedures such as portion size estimation prior to completing the records. Quantitative analysis of completed food records are typically completed by a Registered Dietitian so dietary inadequacies and excesses can be identified. Although food records are typically considered the “gold standard” of dietary assessment, there are a number of limitations to this approach. Food records are time and labor intensive to both the individual completing the record and the individual conducting the dietary analysis. Individuals may also alter their food intake while completing the food record.

### ***Food Frequency Questionnaire***

Food Frequency Questionnaires (FFQs) were developed to assess long-term dietary intake and are often used in epidemiologic studies (Hu 2008). Numerous food frequency questionnaires have been developed and validated for use in specific populations. A food frequency questionnaire consists of a list of food items and beverages. Individuals are asked to report their usual consumption over a specified period of time from a list of frequency categories. The average intake over the designated time period of an assortment of nutrients is calculated based on the individual's responses. FFQs have a number of advantages in epidemiologic studies such as minimal respondent burden and low costs. However, since FFQs lack the detail of dietary records or 24-hour recalls, they provide less accurate estimates of absolute intake.

**TABLE XII-1 Recommended Dietary Intake and Common Food Sources of Selected Nutrients**

<b>Recommended Intake and Common Food Sources of Selected Nutrients</b>				
<b>Nutrient</b>	<b>Recommended Intakes</b>		<b>Food Sources</b>	<b>Nutrient Content</b>
	<b>(RDA/AI) Pregnancy</b>	<b>(RDA/AI) Lactation</b>		
<b>Calcium (mg)</b>	<b>1,300</b> (≤18 years)	<b>1,300</b> (≤18 years)	Fortified ready-to-eat cereals (various), 1 oz	236-1043

Re: Medical Opinion Regarding Occupational Lead Exposure of [NAME OF PATIENT]

Dear Employer:

On [DATE], I conducted a medical evaluation of Ms. [NAME OF PATIENT], who reports being an employee of your company. Based on the information provided by Ms. [NAME OF PATIENT], she performs work at your company that may expose her to lead. A laboratory test performed on [DATE] reported a blood lead concentration of [ENTER RESULT] micrograms per deciliter (µg/dL).

My evaluation of Ms. [NAME OF PATIENT] indicates that she is pregnant or planning to conceive. Lead exposure has been associated with adverse reproductive outcomes, including an increased risk of miscarriage, hypertension during pregnancy, decreased fetal growth, and developmental problems in children born to lead-exposed mothers. The U.S. Centers for Disease Control and Prevention recommends that women who are or may become pregnant limit their exposure to lead.

In accordance with the OSHA Lead Standards [1910.1025(j)-(k), and 1910.1025 App C – Section I. Medical Surveillance and Monitoring Requirements for Workers Exposed to Inorganic Lead, or 1926.62(j)-(k)], this letter represents my medical opinion that Ms. [NAME OF PATIENT] should be removed from lead exposure at your company. This removal should remain in effect until such time that she is no longer pregnant or no longer trying to conceive a child. In the interim, Ms. [NAME OF PATIENT] is capable of continuing to work at a job task or location associated with her employment that would not be expected to result in a blood lead concentration of  $\geq 5$  µg/dL. I am available to discuss the acceptability of any alternative work assignments for the patient with you or one of your representatives.

I have also attached a brochure that discusses the health effects of lead exposure and outlines steps that may be taken to reduce workplace exposure.

Sincerely,

[PHYSICIAN NAME]

**Appendix XV**  
Workplace Hazard Alert for Lead  
Occupational Lead Poisoning Prevention Program  
California Department of Health

# New Health Dangers from Lead

Levels of lead once thought harmless now shown to be toxic

## If you work with lead you need to:

- Find out how much lead is in your blood.
- Talk to your doctor about lead and your health.
- Take steps to protect yourself at work.

## What health damage can low levels of lead cause?

Studies in recent years show that low levels of lead in adults can:

- **increase blood pressure**— may increase your chances of having a heart attack or stroke.
- **decrease brain function**— making it more difficult to think, learn, and remember.
- **decrease kidney function**— making it more difficult to get rid of toxic waste products through your urine.
- **harm the physical and mental development of your baby** before it's born.
- **increase chances of having a miscarriage.**

### Health damage from lead:

- ✱ **Can be permanent.**
- ✱ **Can be occurring even if you have no symptoms.**
- ✱ **May not show up until many years later.**

### You may work with lead if you:

- Make or repair radiators
- Make or recycle batteries
- Recycle scrap metal or electronics
- Melt, cast, or grind lead, brass, or bronze
- Make or glaze ceramics
- Work at a shooting range
- Remove paint or coatings
- Remodel homes and buildings
- Tear down buildings, bridges, or tanks

This is not a complete list. If you are unsure if you work with lead, ask your employer.

**OLPPP**

Occupational Lead Poisoning  
Prevention Program

## How does lead get into my body?

Lead gets into the body through the air you breathe. You can also swallow lead without knowing it if lead dust gets onto your hands or face or on food you eat.

## How do I know how much lead is in my body?

Get a blood lead level test. This test measures the amount of lead in a person's blood. Blood lead test results are reported as micrograms of lead per deciliter of blood ( $\mu\text{g}/\text{dL}$  or  $\text{mcg}/\text{dL}$ ). The typical blood lead level for adults in the U.S. is less than  $2 \mu\text{g}/\text{dL}$ . Even if you feel fine, you should get tested.

**\* Know your number.**

## What level of lead is harmful?

Some of the harmful effects of lead have been seen at very low levels. Scientists and doctors now recommend that blood lead levels be kept below  $10 \mu\text{g}/\text{dL}$ . Pregnant women or women considering pregnancy should not have a blood lead level above  $5 \mu\text{g}/\text{dL}$ .

**\* Blood lead levels should be kept below 10.**

## Will my health be damaged?

No one can predict for sure whether your health will be damaged at a low blood lead level. Your risk (chance) of suffering from health damage increases with the amount of lead in your blood and the length of time you have been exposed. It will also depend on whether you have any health conditions that place you at higher risk of damage from lead.

If your blood lead level has been above  $10 \mu\text{g}/\text{dL}$  for more than a year, the most important thing you can do is take steps to lower your exposure in the future. Information on how you can protect yourself is on pages 4 and 5.

You should also talk to your personal doctor about whether you have any medical conditions that may make you more sensitive to the harmful effects of lead.

### **\* Can lead at work harm my family?**

**YES.** You take lead dust from your job to your family when you wear your work clothes and shoes home. Lead dust can get in your car. It can get on furniture, floors, and carpets.

Your child can swallow this lead dust and be poisoned. The steps you take to protect yourself will also keep you from bringing lead home to your family. See pages 4 and 5 for more information on what you can do.

## What should I tell my doctor?

Your doctor needs to know if you work with lead. Your doctor can order a blood lead level test if you need one. Also, you may have a medical condition that makes you more sensitive to the harmful effects of lead.

### Tell the doctor:

- What you do at work.
- How long you have been at your job.
- Any lead jobs you've had in the past.
- If you've ever had a blood lead level test.
- If you've had to be moved to a different job or be off work because your lead level was high.
- If you think working with lead is making you sick.

Women should also tell their doctor if they are pregnant or considering becoming pregnant.

### Ask the doctor if you:

- Have any medical conditions that may make you more sensitive to the effects of lead.
  - ☐ High blood pressure
  - ☐ Kidney disease
  - ☐ Brain or nerve disease
  - ☐ Other
- Need any follow-up medical tests to see if lead is affecting your health.
  - ☐ Recheck blood pressure
  - ☐ Kidney function tests
  - ☐ Cognitive evaluation
  - ☐ Other

**See the attached clip-off form to fill out and take to your doctor.**

## My blood lead level has been high for years. Should I find other work?

Whether you continue to work with lead is a personal decision. It is often a tough decision to make. When making this decision, consider:

- Are there steps you can take to lower your exposure to lead? See pages 4 and 5 for steps you can take to protect yourself.
- Do you have any health conditions that may make you more sensitive to the harmful effects of lead?
- If you have a medical condition that places you at higher risk, can you transfer to another job without lead at the same company?
- If you change jobs will you receive the same salary and benefits? If not, can you and your family afford a lower paying job?

## For industrial workers

### What can I do to protect myself?

#### **Make sure you don't accidentally swallow lead.**

- Wash your hands and face with soap and water before eating or drinking and before leaving work.
- Do not eat, drink, or smoke in the work area.
- Take a shower and wash your hair as soon as you get home. (It's better to shower at work if you can.)
- Change into clean clothes and shoes at work before you go home. Keep dirty work clothes and shoes separate from clean street clothes. If you don't have a storage locker, keep your dirty clothes and shoes in a plastic bag.
- Use wet cleaning methods. Wet wipe surfaces and mop or HEPA vacuum the shop floor daily.

**\* Get tested  
at least every  
6 months.**

#### **Do what you can to lower the amount of lead you breathe in.**

- If you have local exhaust ventilation, turn it on and position it correctly while you work with lead.
- Ask your employer for a respirator to wear while you work with lead. If you already wear a respirator, ask whether there is another type of respirator that will protect you better. If you use a respirator, your employer has to pay for a doctor to evaluate whether you can wear one safely. Your employer must also provide you with a fit-test to make sure that the respirator fits you well.

#### **Get a blood lead level test at least every 6 months.**

- Ask your employer for a blood lead level test. If you have significant lead exposure at work, your employer must provide you with a test and pay for it.
- Ask your personal doctor for a test if your employer doesn't provide one.

## For construction workers

### What can I do to protect myself?

#### Make sure you don't accidentally swallow lead.

- **Wash your hands and face** with soap and water before eating or drinking and before leaving work. Use a portable plastic container with a spigot if running water is not available.
- **Do not eat, drink, or smoke in the work area.** Move to a clean area for lunch or breaks.
- **Take a shower and wash your hair** as soon as you get home. (It's better to shower at the job site if there are portable showers.)
- **Change into clean clothes and shoes at the job site** before you go home. Keep dirty work clothes and shoes separate from clean street clothes. Dirty clothes and shoes can be stored in a plastic bag.
- **Use wet cleaning methods.** Wet wipe surfaces and wet clean or HEPA vacuum the work area daily.

Strip back paint before cutting or welding.

Attach power tools to a HEPA vacuum.

Use a long-handled torch and stand upwind.

#### Do what you can to lower the amount of lead you breathe in.

- **Use work methods that keep dust and fume levels down.**
- **Ask your employer for a respirator** to wear while you work with lead. If you already wear a respirator, ask whether there is another type of respirator that will protect you better. If you use a respirator, your employer has to pay for a doctor to evaluate whether you can wear one safely. Your employer must also provide you with a fit-test to make sure that the respirator fits you well.

#### Get a blood lead level test at least every 6 months.

- **Ask your employer for a blood lead level test.** If you have significant lead exposure at work, your employer must provide you with a test and pay for it.
- **Ask your personal doctor for a test** if your employer doesn't provide one.

**\* Get tested at least every 6 months.**

## Are there any laws that protect me if I work with lead?

Yes. Your employer must follow special laws to protect you from lead hazards on the job. These laws are called the Cal/OSHA Lead Standards.

The Lead Standards contain many important requirements to protect you from lead. However, because they were written many years ago they are not based on the most recent scientific information. You can have a blood lead level above 10 µg/dL even if your employer follows the standards. That's why it's important for workers and employers to do everything they can to lower the amount of lead in the workplace.

To find out more about the Cal/OSHA Lead Standards, call the Lead in the Workplace Helpline (866/ 627-1587) or visit [www.cdph.ca.gov/programs/olppp](http://www.cdph.ca.gov/programs/olppp).

Talk to your employer if you think there is a lead problem at your job. If your employer does not fix the problem, you can call Cal/OSHA and ask for an inspection. Cal/OSHA will not tell your employer who made the call. Call the Cal/OSHA office in your area or call Cal/OSHA headquarters at (510) 285-7000.

# Worksite Evaluation Form

## What your employer should do to protect you

The best thing that your employer can do is to get rid of lead and lead-containing materials. If it's not possible to get rid of the lead, your employer should take steps to keep the amount of lead in the workplace as low as possible. Your employer should:

- ☐ **Train you to work safely with lead.**
- ☐ **Provide wash-up and shower facilities.**
  - ⇒ If you work in construction these may be portable wash stations and portable showers.
  - ⇒ Your employer should provide you sufficient time to wash up before breaks, lunch, and going home.
- ☐ **Provide clean areas for eating and changing.**
- ☐ **Provide work clothes and work shoes** that stay at the job site.
- ☐ **Provide a HEPA vacuum or tools for wet cleaning** the work area.
- ☐ **Install local exhaust ventilation** whenever possible.
  - ⇒ If there is already local exhaust ventilation your employer should check it regularly to make sure it works well.
- ☐ **Provide you with the right tools to keep lead dust and fume levels down** such as power tools attached to a HEPA vacuum and long-handled torches.
- ☐ **Separate lead work areas from non-lead work areas.**
  - ⇒ In construction, plastic sheeting can be used to isolate dusty work from the surrounding area.
- ☐ **Provide you with a respirator** to give you even more protection.
  - ⇒ If you use a respirator, your employer has to pay for a doctor to evaluate whether you can wear one safely. Your employer must also provide you with a fit-test to make sure that the respirator fits you well.
- ☐ **Provide you with a blood lead level test** at least every six months.

# Lead Health Evaluation Form

## To the worker:

Fill out the upper part of this form as completely as you can and share the form with your doctor. The lower part of the form has information for your doctor on body systems and health conditions that may be affected by lead. Talk to your doctor about any concerns you have.

Your name \_\_\_\_\_ Date of birth \_\_\_\_\_

Your employer's name \_\_\_\_\_

What job do you do now? \_\_\_\_\_ How long have you been at this job? \_\_\_\_\_

Have you worked with lead at other jobs in the past? \_\_\_\_\_

Have you had a blood lead level test done in the past? (List the date(s) and the test results if you know them.) \_\_\_\_\_

Have you ever had to be moved to a different job or be off work because your blood lead level was high? \_\_\_\_\_

Do you think working with lead is making you sick? If yes, explain. \_\_\_\_\_

## To the healthcare provider:

Recent studies show that persistent low-level lead exposures are associated with an increased risk of hypertension, subtle effects on renal function, subclinical cognitive dysfunction, and adverse female reproductive outcome. Please review the following with your patient:

- ☐ Any blood pressure concerns    ☐ Any kidney function concerns
- ☐ Any brain function concerns    ☐ Pregnancy concerns (for female patients of reproductive age)

Follow-up recommendations:

- ☐ Recheck blood pressure?    ☐ Test kidney function with BUN/Cr?
- ☐ Cognitive evaluation?    ☐ Other?

For health care providers with questions about medical management of lead-exposed California workers, please call Dr. Ray Meister of the Occupational Lead Poisoning Prevention Program at (510) 620-5731.

**Subject:** RE: Breast feeding and maternal lead exposure

In adults when we see high levels it is generally an occupational exposure and inhalation of lead fumes in industrial exposure settings like battery manufacturing, lead smelting, and stained lead glass.

A couple of factors are important to remember when we are talking about lead exposure in adults versus children. Absorptions rates from gastrointestinal exposure are lower in adults versus children. So where a toddler might absorb about 50%, absorption rates decline in adults to 3-10%. About 90% of lead will end up in the bone where it mimics calcium. It causes less harm there then if it went to soft tissues like the liver or kidneys. The problem is that under circumstances that cause calcium mobilization, lead stored in the bone may remobilize and circulate in the blood, elevating blood lead levels. The mobilization of stored lead with pregnancy, menopause, and aging is a cause for concern. So to help mitigate that there should be an emphasis on good nutrition and a calcium rich diet. Pregnant and breastfeeding woman should be sure to take their vitamins to minimize calcium mobilization from the bones.

Reinforcing these messages would help minimize exposure.

Looping I our toxicologist, as we have discussed this. Note that anyone should be using filtered or bottled water now, so that the issue of which house and which risk should already be addressed. Also- we do not have any data supporting adults with blood lead levels that high ( Off top of my head) and none have been in the 40's or higher since Long before April 2014.

Regardless, Linda and I had talked about breastfeeding moms... She can help.

Eden

Thank you for your quick answer!

This makes sense for pregnant moms, as there is no choice as to how the baby will get its nourishment. However, for breastfeeding moms in households in which filters will be provided, **do we know that breast milk (with possible higher maternal BLLs secondary to bone release from chronic exposure) is preferable to filtered tap water?** Does anybody know what the range of breast milk lead levels are in women who have BLLs around 30 or 35? In the data that Dr. Reynolds and I

looked at (previously attached) the BLLs didn't go that high, and it said that the breast milk levels fluctuated.

In the Ettinger paper the highest maternal BLL with a breast milk sample was 29.9 (Table 1), which is less than the level of 40 recommended in the MDHHS handout. The article said that "Breast milk lead expressed as percentage of maternal blood lead ranged from 0.4 to 9.2% (mean = 1.6%, SD = 1.2%)" -- p 929. The means a less an issue than the outliers, considering some of the extremely high water lead levels that have been found in the city and also the difficulty of predicting which houses might be most at risk.

I'm not sure if there is other, better data out there that might shed some light on this? Also, your attached pamphlet does deflect patients back to their doctors, but I'm not sure that those of us in the GCMS feel that we have adequate information to advise people further.

**Cc:** 'Lawrence Reynolds'; '[REDACTED] PPI'; Peter Levine; Mark Valacak  
**Subject:** RE: Breast feeding and maternal lead exposure

Good morning,

Note that MDHHS/GCHD is about to send out (by emails and hopefully you all can disseminate at will to your colleagues?) a provider letter with provider resources, which will also all be on the webpage we are using. Parent letters with resources for them will be going out in hard copy through schools and daycares---all of this will be occurring in the next couple of days. Note that there is already a flyer on the [Michigan.gov/flintwater](http://Michigan.gov/flintwater) webpage for pregnant moms and breastfeeding---note that, like all others including children, treatment only occurs for levels over 45, but removing lead from any environmental sources is important at all times.

We have already gotten information regarding pregnancy and lead levels from CDC: (Mary Jean Brown): "Pregnant women who work with lead should be tested (occupational, hobby, shooting ranges, renovation exposures). Worried women who want to be tested should not be refused but if their only exposure is the water the only intervention is to stop drinking the water from the river and it is my understanding that that has been accomplished. There is no medical treatment for pregnant women (chelation therapy) in the first trimester because of teratogenic concerns. At blood lead levels  $\geq 45$  in later trimesters, chelation may be considered to protect the fetus but should only be done in consultation with someone familiar with chelation in early childhood and high risk pregnancies. A general alert to area OB/Gyn's and maternity clinics that patients should not drink water from the river, would be advisable."

**Subject:** Breast feeding and maternal lead exposure

Dear Eden,

Our county medical society is in the process of drafting a “fact sheet” specifically for our physician members to try and help them help their patients. We are endeavoring to keep the content consistent with the other messaging going out, but to use as many channels as we can, and to make this very easy for physicians to digest (i.e. brief and pertinent to their patients). I am attaching our draft to this email, as well as some of the articles that we have found.

One of the questions that came up is what to tell lead-exposed mothers who are pregnant or breastfeeding. We have pulled a number of articles that talk about lower maternal BLLs, but these are usually in the context of lower lead levels in drinking water. We are not sure if these recommendations still hold in our situation: the water is variable, the mothers are not routinely tested (should they be?), and lead is released from maternal bone for a long time. We also read that the lead levels fluctuate. All of this is to say, we are not certain that breastfeeding is safer than using filtered water in our situation (though it pains us as pediatricians and family docs to suggest this) and also, what the safe BLL is for a mother? The MDHHS recommendation of 40 in the recent Lead Week Toolkits seemed high, considering the fluctuating BLL and bone storage.

You had previously asked your toxicologist about the copper levels for us, and I was hoping you might pose this question to them as well.

Thank you for your help!

Laura Carravallah, MD

Ok- I totally get that- but even if we can get something pretty aggregate that could help- something we would never need to back off in- this data set sounds quite complex!!

No more talk this weekend about it. Rest- you deserve it- as does your whole team!!!!

Patty just got the data this morning. It's not straight forward as it appears that some kids who were tested some time ago have been recently retested. If we rush the analysis, we run the risk of again having to backtrack and admit mistakes. It might be possible to have preliminary data sooner than the 9th but I heard the director say do it right not fast. Meanwhile I can't even get anyone to tell me what the front office wants. If I could get some insight on the minimal data requested and a reasonable date, we can try to meet that.

**Subject:** Re: Flint Lead

Just a follow-up, Mary Jean and Sue,

Our CLPP lead, nancy, has the contacts I was looking for: FYI only-

Evidence-based home visiting programs that have evidence of effectiveness impacting child development, which could include Healthy Families America, Early Head Start, Parents As Teachers.

2. Early On services (Michigan's name for services under Part C of IDEA).
3. High quality child care
4. Special Education services

MDHHS is generally the lead on #1, while #2-4 are managed within the MDE Office of Great Start, under Susan Broman (Deputy Superintendent). Under Susan, the contacts would be Renee DeMars-Johnson (infant/toddler programs) and Richard Lower (preschool programs), and Lisa Brewer-Walraven (child care).

Hope that helps -- and I've added a few notes below, not sure if the additional info is what you are looking for, feel free to skip that part!

Nancy

Good morning, Mary Jean,

Dr. Reynolds forward the great CDC report you authored about Educational Needs for Children Affected by Lead from earlier this year. I am looping in someone from our Michigan Department of Education to be a state point person regarding this report, and I wondered if you already had a contact there.

Also, I hadn't gotten any follow-up but had heard you may be coming to Flint at some point, and I am hoping that we can connect.

Warm Regards,

Eden

Jordan,

Rep Kildee mentioned the other day that he spoke with the CDC Director about what was going on in Flint and that the CDC director was aware and was following the situation.

I think there is an incredible opportunity here for the CDC to help us build a model public health program. Ok, so our entire population has been exposed to this neurotoxin, now what do we do? We could do nothing and wait 10-20 years and see the impact of lead poisoning, or we can try to defy the odds and build an innovative model public health program that buffers the exposure. We have created something called FLINT - Flint Lead INNOvation Team - that is trying to do just that. Drawing on the burgeoning science of toxic stress and developmental neuroscience, we hope to use short term and long term interventions that can build resilience in our kids. Things like nutrition, early head start, medical homes, home visiting programs, parenting, etc. Of course, we have no money or resources to do any of this yet. I can share more details if you like.

So do you think we should also contact the CDC dude? Do you know what Kildee asking him for specifically?

thanks, mona

We are getting nudged from a couple different fronts- including Rep Kildee office and the Flint Innovation team--- to engage with CDC and ask for assistance/support as part of the health response to Flint Water situation. In order for CDC to engage with state, a request must be made by state, ie. From the State Health Official, State Environmental Director, State Epidemiologist.

When I was in Salt Lake City for annual ASTHO meeting, I did alert Judy Monroe, Deputy Director, Office for State, Tribal, Local, and Territorial Support (OSTLTS) about Flint water situation. Judy is a key advisor to the CDC director for the support of US health departments, tribal nations, and insular areas. She oversees key activities and technical assistance that support the nation's health departments and the public health system, and would be my first point of contact if we were to seek CDC assistance.

The CDC is an invaluable resource and it would be very beneficial to have their support and expertise, and who knows, possibly additional funding, as we address both short term and long term consequences of the lead exposure. **Do we all agree that Michigan should reach out to the CDC at this time? Would you like me to work with Eden to draft our request to Judy for your review?**

See excerpts below from recent communication between Dr Hanna Attisha and Rep Kildee office.

**Subject:** Re: [Flint Water Advisory Task Force] FW: [DEQ] Freeman Elementary water testing shows lead exposure limited to fixtures

It would seem that this is an attempt to place responsibility going forward on the shoulders of these schools. Damage sustained to these fixtures and plumbing occurred while the corrosive Flint river water ran through them. Replacing plumbing and fixtures must not be a financial burden that schools ... or residents .... should bear.

I am so weary of the MDEQ and LAN "diverting scrutiny." How in the world could anyone ever hope to rebuild trust with these attitudes persisting?

Freeman Elementary water testing shows lead exposure limited to fixtures

Experts release water testing results on schools and homes in Flint

Nov. 9, 2015

For More Information:

George Krisztian, 517-284-6719, [krisztiang@michigan.gov](mailto:krisztiang@michigan.gov)

As part of Gov. Rick Snyder's action plan for Flint drinking water, the DEQ today released water testing data from nearly 400 homes and businesses in Flint as well as comprehensive sampling results from Freeman Elementary School.

Both sets of data indicate the problems with lead are localized to individual buildings or even individual faucets, rather than system-wide issues.

"The results from this data underline the need for water testing at all homes, businesses, schools and other buildings in Flint," said George Krisztian, the DEQ's Flint Action Plan Coordinator. "Problems with lead exposure appear to be localized to individual service lines or plumbing fixtures, and we want to see all families in Flint take advantage of free water testing from the state."

#### Freeman Elementary testing results

At Freeman Elementary, 31 faucets were tested using a series of four samples each. Twenty-two outlets did not show elevated lead exposure, but nine faucets came back with initially high results.

Those nine outlets involve brass components, indicating the problem involves the fixtures or plumbing immediately surrounding the fixture. When the faucets and fountains were operated for several minutes, lead levels fell significantly, in some cases to non-detectable levels.

Additional testing designed to look deep into the school's plumbing did not suggest larger, systemic issues.

Freeman Elementary has several options for remedying the issues at these nine faucets and fountains. The school can elect not to use those particular fountains, or implement a formalized flushing regimen. The sampling results indicate that for all but one tap, a 3- to 4-minute flushing period each morning would drastically reduce lead exposure.

For a permanent solution, the school should opt to replace the faucets and fountains of concern.

"The safety and health of our students are our primary concern at Flint Community Schools, so we will start work as soon as possible to replace faucets, aerators and other related components where high lead levels were detected," FCS Superintendent Bilal Tawwab said. "Once those fixes have been made, the DEQ has offered to provide additional testing of the water at Freeman Elementary to ensure the water from every sample is safe for our students. Flint Community Schools appreciates the efforts by the DEQ, working with all stakeholders to make sure our water continues to be tested and that our students have access to safe, clean drinking water."

For Freeman Elementary's complete sampling results and more information about how sampling was conducted, visit [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater).

The DEQ and the DLARA also have conducted sampling at other Flint schools, and results will soon be available on the DEQ's website. Additionally, the state will test every other school in the Flint Community Schools district, as well as any school or daycare in the city. Interested schools and daycare centers should contact George Krisztian at [krisztiang@michigan.gov](mailto:krisztiang@michigan.gov).

#### Homeowner and other customer-requested testing results

Results from the 381 samples from homes, businesses, schools and other facilities that took advantage of free water testing through the state showed similar, localized results. More than 75 percent of the samples analyzed demonstrated lead results of 5 parts per billion or less, and more than 91 percent demonstrated lead results of 15 parts per billion or less.

This data suggests that while some homes experience elevated lead level results due to lead service lines or in-home plumbing, many other homes experience little to no lead. This can make it difficult for homeowners and businesses to predict their lead exposure.

"Since it's not easy to predict if an individual home's water is at risk for lead, the best thing all residents

can do is get their water tested,” Krisztian said. “It’s a free test that provides valuable information for families.”

Testing is available for free by contacting the Flint Water Plant at 810-787-6537 and pressing 1, or by emailing [flintwater@cityofflint.com](mailto:flintwater@cityofflint.com).

For more information about water samples received through the state’s free testing program, visit [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater).

#### How school sampling was conducted

To conduct this comprehensive sampling, the DEQ and Michigan Department of Licensing and Regulatory Affairs began on Oct. 23 with a thorough plumbing assessment of the school to gain a detailed understanding of how water moves through the building and what types of plumbing materials are used. The assessment also identified 31 faucets or fountains in the school that provide water for drinking, cooking and/or food preparation.

On Oct. 24, the DEQ and DLARA took four, 125-milliliter samples from each of the 31 identified faucets and fountains. The first two samples were taken immediately after turning on the faucet, followed by a 30-second flush and then the third sample, followed by a 2-minute flush and then the fourth sample. These samples provided information on the impact of any lead sources in or around each specific faucet and fountain as well as its connecting plumbing.

On Oct. 31, the DEQ and DLARA took an additional 30 samples, 10 each from three sites in the school. These 1-liter samples were taken consecutively, and provided information about the impact of any lead sources deep in the building’s plumbing.

For a video about these results, visit <https://youtu.be/Amy4cDW7RtA>.

Freeman Elementary water testing shows lead exposure limited to fixtures

Experts release water testing results on schools and homes in Flint

Nov. 9, 2015

For More Information:

George Krisztian, 517-284-6719, [krisztian@michigan.gov](mailto:krisztian@michigan.gov)

As part of Gov. Rick Snyder's action plan for Flint drinking water, the DEQ today released water testing data from nearly 400 homes and businesses in Flint as well as comprehensive sampling results from Freeman Elementary School.

Both sets of data indicate the problems with lead are localized to individual buildings or even individual faucets, rather than system-wide issues.

"The results from this data underline the need for water testing at all homes, businesses, schools and other buildings in Flint," said George Krisztian, the DEQ's Flint Action Plan Coordinator. "Problems with lead exposure appear to be localized to individual service lines or plumbing fixtures, and we want to see all families in Flint take advantage of free water testing from the state."

Freeman Elementary testing results

At Freeman Elementary, 31 faucets were tested using a series of four samples each. Twenty-two outlets did not show elevated lead exposure, but nine faucets came back with initially high results. Those nine outlets involve brass components, indicating the problem involves the fixtures or plumbing immediately surrounding the fixture. When the faucets and fountains were operated for several minutes, lead levels fell significantly, in some cases to non-detectable levels.

Additional testing designed to look deep into the school's plumbing did not suggest larger, systemic

issues.

Freeman Elementary has several options for remedying the issues at these nine faucets and fountains. The school can elect not to use those particular fountains, or implement a formalized flushing regimen. The sampling results indicate that for all but one tap, a 3- to 4-minute flushing period each morning would drastically reduce lead exposure.

For a permanent solution, the school should opt to replace the faucets and fountains of concern.

“The safety and health of our students are our primary concern at Flint Community Schools, so we will start work as soon as possible to replace faucets, aerators and other related components where high lead levels were detected,” FCS Superintendent Bilal Tawwab said. “Once those fixes have been made, the DEQ has offered to provide additional testing of the water at Freeman Elementary to ensure the water from every sample is safe for our students. Flint Community Schools appreciates the efforts by the DEQ, working with all stakeholders to make sure our water continues to be tested and that our students have access to safe, clean drinking water.”

For Freeman Elementary’s complete sampling results and more information about how sampling was conducted, visit [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater).

The DEQ and the DLARA also have conducted sampling at other Flint schools, and results will soon be available on the DEQ’s website. Additionally, the state will test every other school in the Flint Community Schools district, as well as any school or daycare in the city. Interested schools and daycare centers should contact George Krisztian at [krisztiang@michigan.gov](mailto:krisztiang@michigan.gov).

Homeowner and other customer-requested testing results

Results from the 381 samples from homes, businesses, schools and other facilities that took advantage of free water testing through the state showed similar, localized results. More than 75 percent of the samples analyzed demonstrated lead results of 5 parts per billion or less, and more than 91 percent demonstrated lead results of 15 parts per billion or less.

This data suggests that while some homes experience elevated lead level results due to lead service lines or in-home plumbing, many other homes experience little to no lead. This can make it difficult for homeowners and businesses to predict their lead exposure.

“Since it’s not easy to predict if an individual home’s water is at risk for lead, the best thing all residents can do is get their water tested,” Krisztian said. “It’s a free test that provides valuable information for families.”

Testing is available for free by contacting the Flint Water Plant at 810-787-6537 and pressing 1, or by emailing [flintwater@cityofflint.com](mailto:flintwater@cityofflint.com).

For more information about water samples received through the state’s free testing program, visit [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater).

How school sampling was conducted

To conduct this comprehensive sampling, the DEQ and Michigan Department of Licensing and Regulatory Affairs began on Oct. 23 with a thorough plumbing assessment of the school to gain a detailed understanding of how water moves through the building and what types of plumbing materials are used. The assessment also identified 31 faucets or fountains in the school that provide water for drinking, cooking and/or food preparation.

On Oct. 24, the DEQ and DLARA took four, 125-milliliter samples from each of the 31 identified faucets and fountains. The first two samples were taken immediately after turning on the faucet, followed by a 30-second flush and then the third sample, followed by a 2-minute flush and then the fourth sample. These samples provided information on the impact of any lead sources in or around each specific

faucet and fountain as well as its connecting plumbing.

On Oct. 31, the DEQ and DLARA took an additional 30 samples, 10 each from three sites in the school. These 1-liter samples were taken consecutively, and provided information about the impact of any lead sources deep in the building's plumbing.

For a video about these results, visit <https://youtu.be/Amy4cDW7RIA>.

The message regarding lead paint from some in the City of Flint and the DEQ in yesterdays meeting was purely an effort to mitigate their sense of responsibility. We need to make sure that stops. It is not even remotely the truth.

If EBLLs are due to sources other than water, why did the frequency double only in Flint and not other areas in Genesee County. Why in wards where they were already high before the change in water source? Or did paint chips become more tasty on the inside of Flint only but not across the street on the fringes?

Is the DEQ working with MDHHS and local epidemiologists or just their chemists?

Why are BLLs not higher in the catchment areas for the schools with the higher WLLs?

Are there mitigating factors in the tested schools's student population?

Check out BLLs in children under 2 or three before BLLs decline and they start school

Does this mean lead in city water is ok?

We have repeatedly stated that the powder formula fed children under 6-12 months of age are at the greatest risk and the least tested. Add pregnant and breast feeding women with adults with decreased renal function or failure.

This appears to be an attempt to divert scrutiny or, at best, an answer to another question. The decision to not monitor schools until recently is in itself problematic. There has always been the school problem, which is a separate issue, perhaps exacerbated by water quality.

Freeman Elementary water testing shows lead exposure limited to fixtures

Experts release water testing results on schools and homes in Flint

Nov. 9, 2015

For More Information:

George Krisztian, [517-284-6719](tel:517-284-6719), [krisztiang@michigan.gov](mailto:krisztiang@michigan.gov)

As part of Gov. Rick Snyder's action plan for Flint drinking water, the DEQ today released water testing data from nearly 400 homes and businesses in Flint as well as comprehensive sampling results from Freeman Elementary School.

Both sets of data indicate the problems with lead are localized to individual buildings or even individual faucets, rather than system-wide issues.

"The results from this data underline the need for water testing at all homes, businesses, schools and other buildings in Flint," said George Krisztian, the DEQ's Flint Action Plan Coordinator. "Problems with lead exposure appear to be localized to individual service lines or plumbing fixtures, and we want to

see all families in Flint take advantage of free water testing from the state.”

#### Freeman Elementary testing results

At Freeman Elementary, 31 faucets were tested using a series of four samples each. Twenty-two outlets did not show elevated lead exposure, but nine faucets came back with initially high results. Those nine outlets involve brass components, indicating the problem involves the fixtures or plumbing immediately surrounding the fixture. When the faucets and fountains were operated for several minutes, lead levels fell significantly, in some cases to non-detectable levels.

Additional testing designed to look deep into the school’s plumbing did not suggest larger, systemic issues.

Freeman Elementary has several options for remedying the issues at these nine faucets and fountains. The school can elect not to use those particular fountains, or implement a formalized flushing regimen. The sampling results indicate that for all but one tap, a 3- to 4-minute flushing period each morning would drastically reduce lead exposure.

For a permanent solution, the school should opt to replace the faucets and fountains of concern.

“The safety and health of our students are our primary concern at Flint Community Schools, so we will start work as soon as possible to replace faucets, aerators and other related components where high lead levels were detected,” FCS Superintendent Bilal Tawwab said. “Once those fixes have been made, the DEQ has offered to provide additional testing of the water at Freeman Elementary to ensure the water from every sample is safe for our students. Flint Community Schools appreciates the efforts by the DEQ, working with all stakeholders to make sure our water continues to be tested and that our students have access to safe, clean drinking water.”

For Freeman Elementary’s complete sampling results and more information about how sampling was conducted, visit [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater).

The DEQ and the DLARA also have conducted sampling at other Flint schools, and results will soon be available on the DEQ’s website. Additionally, the state will test every other school in the Flint Community Schools district, as well as any school or daycare in the city. Interested schools and daycare centers should contact George Krisztian at [krisztiang@michigan.gov](mailto:krisztiang@michigan.gov).

Freeman Elementary water testing shows lead exposure limited to fixtures

Experts release water testing results on schools and homes in Flint

Nov. 9, 2015

For More Information:

George Krisztian, [517-284-6719](tel:517-284-6719), [krisztiang@michigan.gov](mailto:krisztiang@michigan.gov)

As part of Gov. Rick Snyder's action plan for Flint drinking water, the DEQ today released water testing data from nearly 400 homes and businesses in Flint as well as comprehensive sampling results from Freeman Elementary School.

Both sets of data indicate the problems with lead are localized to individual buildings or even individual faucets, rather than system-wide issues.

"The results from this data underline the need for water testing at all homes, businesses, schools and other buildings in Flint," said George Krisztian, the DEQ's Flint Action Plan Coordinator. "Problems with lead exposure appear to be localized to individual service lines or plumbing fixtures, and we want to see all families in Flint take advantage of free water testing from the state."

Freeman Elementary testing results

At Freeman Elementary, 31 faucets were tested using a series of four samples each. Twenty-two outlets did not show elevated lead exposure, but nine faucets came back with initially high results. Those nine outlets involve brass components, indicating the problem involves the fixtures or plumbing immediately surrounding the fixture. When the faucets and fountains were operated for several minutes, lead levels fell significantly, in some cases to non-detectable levels.

Additional testing designed to look deep into the school's plumbing did not suggest larger, systemic issues.

Freeman Elementary has several options for remedying the issues at these nine faucets and fountains. The school can elect not to use those particular fountains, or implement a formalized flushing regimen. The sampling results indicate that for all but one tap, a 3- to 4-minute flushing period each morning would drastically reduce lead exposure.

For a permanent solution, the school should opt to replace the faucets and fountains of concern.

"The safety and health of our students are our primary concern at Flint Community Schools, so we will start work as soon as possible to replace faucets, aerators and other related components where high lead levels were detected," FCS Superintendent Bilal Tawwab said. "Once those fixes have been made, the DEQ has offered to provide additional testing of the water at Freeman Elementary to ensure the water from every sample is safe for our students. Flint Community Schools appreciates the efforts by the DEQ, working with all stakeholders to make sure our water continues to be tested and that our students have access to safe, clean drinking water."

For Freeman Elementary's complete sampling results and more information about how sampling was conducted, visit [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater).

The DEQ and the DLARA also have conducted sampling at other Flint schools, and results will soon be available on the DEQ's website. Additionally, the state will test every other school in the Flint Community Schools district, as well as any school or daycare in the city. Interested schools and daycare centers should contact George Krisztian at [krisztiang@michigan.gov](mailto:krisztiang@michigan.gov).

Homeowner and other customer-requested testing results

Results from the 381 samples from homes, businesses, schools and other facilities that took advantage of free water testing through the state showed similar, localized results. More than 75

percent of the samples analyzed demonstrated lead results of 5 parts per billion or less, and more than 91 percent demonstrated lead results of 15 parts per billion or less.

This data suggests that while some homes experience elevated lead level results due to lead service lines or in-home plumbing, many other homes experience little to no lead. This can make it difficult for homeowners and businesses to predict their lead exposure.

"Since it's not easy to predict if an individual home's water is at risk for lead, the best thing all residents can do is get their water tested," Krisztian said. "It's a free test that provides valuable information for families."

Testing is available for free by contacting the Flint Water Plant at [810-787-6537](tel:810-787-6537) and pressing 1, or by emailing [flintwater@cityofflint.com](mailto:flintwater@cityofflint.com).

Some additional ideas:

- The health department has some great tools available that could be used to help locate families - it can check the WIC records, and/or check MCIR to see if there is a new address listed.
- Between GCHD and MDHHS, we should also have a way to check Medicaid records for any new addresses.
- We may also be able to work with other colleagues within MDHHS to see if they can check databases related to other public benefits such as SNAP.
- Mark Miller also had a good suggestion, to connect with the STD (HIV?) investigator that works in Flint, to share the strategies he uses to locate people; Karen Lishinski has his name and can share it with the nurses, or the health department staff probably already know him.
- The schools may also be able to share updated information they have about addresses (if the child is school-aged); we talked briefly to MDE about this last week, and they said the local school district would be the best resource, as the state school database doesn't retain the kind of information that the nurses would be seeking.

Per our state-local call yesterday, it is hard to find some of these children with EBLs due to their changing addresses. Would partnering with the local health providers help, as these children are hopefully getting primary care locally?

Gary, are you in touch with Drs. Hanna, Reynolds, Levine and others---perhaps there is a way to query their databases to locate children for follow-up of EBLs since April 2014? I am not sure if HIPAA would play a role, but seems that we could find a few of these children.

Just thinking out loud....

**To:** Mona Hanna-Attisha  
**Subject:** EBLs

I just heard today GCHD planning, maybe-possibly, 1-2 more information fairs that will also do testing...my understanding is rationale similar to the one done yesterday- that many of the Medicaid tests for 1-year olds still needed; while may not catch an affect from water switch, would catch any EBLs so they can get an EBL investigation ( which now includes water). I would be interested in your thoughts about how yesterday went- heard good things in news but have been in Detroit all day and have not heard much else.

Subject: RE: Zip codes on EBL one pager and zip code sheet

There are some cases in those zips (01 and 02). They are included in the Flint total.

Subject: Zip codes on EBL one pager and zip code sheet

Hi there! Thank you all for your help! On the suppressed zip code file-can the far right column in the right (zip 01-07) be changed to 03-07?

I don't think 01 and 02 have residences...

**The Flint Water Crisis: A Panel Discussion**  
**Wednesday, November 18**  
**6:00-8:00pm, 303 International Center**

Please join moderator **Dr. Sara Fingal** (History/Lyman Briggs, Michigan State University) and panelists **Dr. Jennifer Carrera** (Sociology/Environmental Science & Policy Program, Michigan State University), **Dr. Susan Masten** (Civil and Environmental Engineering, Michigan State University), **Melissa Mays** (Water You Fighting For?), and **Claire McClinton** (Democracy Defense League) for a discussion and audience Q&A on the Flint water crisis.

Following the Flint city government's decision to no longer source its water supply from Detroit, but rather pump its water supply from the Flint River without properly treating it, old pipes further corroded and lead levels dangerously spiked, contaminating the water of Flint residents, businesses, and schools. Now the EPA has been called in to investigate Flint's water contamination and has recently announced it will audit the entire state's drinking water program to "ensure that MDEQ maintains reliable drinking water supplies that meet all of the requirements of the Safe Drinking Water Act."

#### **PANELISTS:**

**Sara Fingal** specializes in environmental history, twentieth century U.S. history, the history of coastal zone management, water resources, environmental politics, policy, and planning, and U.S. social movements. Her work to date ties together urban and rural history with an analysis of landscapes and ecosystems that transcend municipal, state, and national boundaries throughout North America. She has extensive experience performing oral history interviews with former civil rights and environmental activists, state politicians, officials, and employees.

**Jennifer Carrera** is part of the campus-wide Global Water Initiative. Her area of research focuses on environmental justice issues of access to clean water and sanitation in low-income communities domestically and internationally. Her work examines the role of power and exclusion in the production of marginalized spaces and bodies, using water as a surrogate for mapping power.

**Susan Masten's** research involves the use of chemical oxidants for the remediation of soils, water, and leachates contaminated with hazardous organic chemicals. She has been working extensively to develop water treatment technologies that are more effective and suitable for use in decentralized water treatment systems. She is currently testing a few samples from Flint for disinfection byproducts.

**Melissa Mays** is a founder of the citizen advocacy group Water You Fighting For and is often quoted in articles and interviews on the ongoing Flint water crisis ([www.theguardian.com/us-news/2015/oct/04/flint-michigan-lead-water-children-health](http://www.theguardian.com/us-news/2015/oct/04/flint-michigan-lead-water-children-health)). In August 2015, WYFF distributed 300 test kits to households and worked with volunteer research scientists and grad students to get them tested in order to prove lead toxicity in the city water supply. She was among the petitioners to the EPA on October 1, 2015, urging them to take emergency action under the Safe Drinking Water Act in order to protect Flint residents from the toxic water conditions ([www.nrdc.org/media/2015/151001a.asp](http://www.nrdc.org/media/2015/151001a.asp)).

**Claire McClinton** works extensively with Democracy Defense League and is often quoted in Michigan articles and interviews on the ongoing Flint water crisis. She was among the petitioners to the EPA on October 1, 2015, urging them to take emergency action under the Safe Drinking Water Act in order to protect Flint residents from the toxic water conditions ([www.nrdc.org/media/2015/151001a.asp](http://www.nrdc.org/media/2015/151001a.asp)). She is also active with local and statewide community activities centered around exposing the dangers of the Emergency Manager law, and other organization affiliations include the Michigan Poverty Roundtable and Stand Up for Democracy.

This event is co-sponsored by the Center for Gender in Global Context (GenCen), Gender Justice & Environmental Change (GJEC), Community Sustainability, and Lyman Briggs at MSU.

Hi- sorry - was in phone with parents--- wow!!!! Vacation! Well-deserved for both you and your family!

I think 2 or 3 - I have it written down in my Lansing office. Was very happy with fast response from primary provider ( can relay that when we talk sometime). Let's not disrupt your vacation- can talk next week- but needing to see if we can expand testing by primary care providers ( like the case with this child) to ensure maximal surveillance.

The 3rd is busy for you all- and wonder if a webinar the following week may be better--- and if you think it would be a useful thing to do? I would also love to come to the Grand Rounds- I don't need to register do I?

Eden

I do know that they are revising (revised?) the protocols from what I see by email traffic....I know that our MDHHS/GCHD EBL investigators or going without flushing and using large mouth bottles as well. I will check on the retesting of prior tests...

Interesting - probably more paint or additive at that level. do you know if the state/city/county water sampling for these investigations is now being done as recommended by EPA? Are they going to go back to repeat the water sampling on the cases that was done with the wrong process (flushing, narrow opening bottles, etc).

The protocol that we are using in the EBL investigations does not include pre-flush. I'm not sure if DEQ has revised their state-wide protocol, but the city of Flint issued new instructions to homeowners (see attached) that does not include the pre-flush. The only issue that I think is outstanding is the wide-mouth vs narrow-mouth bottle issues that was discussed by the TAC via e-mails. I believe Flint is telling residents they can get their water re-tested if they had earlier tested under the flushing protocol.

**Michigan Department of Health and Human Services Environmental Health**

**Flint Water Lead Project**

**MDHHS Situation Report**

**\*\*NOTE: Potentially Identifiable Information- REDACT AS INDICATED\*\***

**Daily Briefing and Situation Report**

**Date:** November 25, 2015

**Surveillance Indicators:** People Tested since 10/1/2015: 1,395;

Children 0-6 > 5 mcg/dl since 10/1/2015: 26

**Severity Indicators:** Hospitalized/Discharged-1/1; Deaths- 0

**DAILY ACTIVITY SUMMARY**

**Elevated Blood Level (EBL) Investigations**

- DEH-Residential tap water sampling protocol used to evaluate lead concentrations in households finalized
- Contractor (ETC) has 4 EBL investigations scheduled in the next 2 weeks and DEH staff are working to schedule more
  - ETC anticipates up to 6 investigations/week
  - Reports, with lab analysis, expected 2-3 weeks to complete

**Epidemiology/Surveillance**

- 1 child hospitalized 11/18-11/20, <2 yo, identified by lab who contacted primary provider with level of 52 mcg/dl; hospitalized at Children's 11/18; follow-up tests decreased without need for chelation- discharged to home 11/20.
  - GCHD follow-up 11/23 and 11/24- case management and investigation in process- possible history of lead paint ingestion
  - Child with history of anemia.
  - Other children in household tested, also followed by PCP.
- Since 10/1/2015 an additional 1,395 people have been testing in Flint; 26 children > 5 mcg/dl
  - 3% of children tested since 10/1/2015 have tested > 5 mcd/dl
- DEH staff developing comprehensive database
  - compiles blood test results, case management services, and environmental sampling data for each Flint child with elevated blood lead level

**Communications/Information Sharing**

- MDHHS/GCHD weekly call Nov 24 3PM- update on EBL testing
- Technical Advisory Committee meeting originally scheduled for December 9<sup>th</sup> - postponed by City of Flint- unknown status at this time for next meeting

### **Health Education Resources**

- Bathing-specific fact sheet under development:
  - Dr. Wells to ask Dr. Hannah-Attisha for quote
- DEH has drafted a phosphate fact sheet, reviewing/revising with DEQ Drinking Water Staff
- DEH working with CLPPP and GCHD to revise parent resources package
  - reduce reading level

### **WIC**

- Letter sent 11/24 to GCHD about Ready-to-feed formula availability from WIC program
- Talking points for WIC staff and for providers shared

### **Healthcare/Providers**

- Forum for primary care providers in Flint by public health being planned- 2<sup>nd</sup> – 3<sup>rd</sup> week December
- WIC information to be shared by GCHD to providers

### **DEQ Information**

- Samples taken from only once school over weekend due to inclement weather
- Results pending for all schools other than Freeman

**MDHHS Situation Report**

**\*\*NOTE: Potentially Identifiable Information- REDACT AS INDICATED\*\***

**Daily Briefing and Situation Report**

**Date:** November 25, 2015

**Surveillance Indicators:** People Tested since 10/1/2015: 1,395;

Children 0-6 > 5 mcg/dl since 10/1/2015: 26

**Severity Indicators:** Hospitalized/Discharged-1/1; Deaths- 0

**DAILY ACTIVITY SUMMARY**

**Elevated Blood Level (EBL) Investigations**

- DEH-Residential tap water sampling protocol used to evaluate lead concentrations in households finalized
- Contractor (ETC) has 4 EBL investigations scheduled in the next 2 weeks and DEH staff are working to schedule more
  - ETC anticipates up to 6 investigations/week
  - Reports, with lab analysis, expected 2-3 weeks to complete

**CLPP/GCHD Case Management (CM)**

- Week Ending 11/20/15:
  - Number of contacts attempted: 58
  - Contacted and offered CM: 13
- 2.5 FTE's (two nurses and 1 staff) hired; 1 more FTE nurse to be hired

**Epidemiology/Surveillance**

- 1 child hospitalized 11/18-11/20, <2 yo, identified by lab who contacted primary provider with level of 52 mcg/dl; hospitalized at Children's 11/18; follow-up tests decreased without need for chelation- discharged to home 11/20.
  - GCHD follow-up 11/23 and 11/24- case management and investigation in process- possible history of lead paint ingestion
  - Child with history of anemia.

Here's da points

## **Legionellosis Investigation Summary Points**

### **Legionellosis Background:**

*Legionella* is a type of bacteria found naturally in fresh water environments. This bacteria grows best in warm water, like the kind found in hot tubs, cooling towers, hot water tanks, potable water systems, and decorative fountains. People are exposed to *Legionella* when they breathe in a mist or vapor containing the bacteria. When people are exposed to the bacteria, it can cause illness. Legionellosis is a respiratory disease caused by *Legionella* bacteria.

*Legionella* cannot spread from one person to another person. Most people exposed to the bacteria do not become ill. People at higher risk of getting sick include: individuals over 50 years old; current or former smokers; those with chronic lung disease; people with a weakened immune system from diseases like cancer, diabetes, or kidney failure; and individuals who take medications that weaken the immune system, such as steroids or chemotherapy. Cases of legionellosis are most common during the late spring through early fall

### **Investigation Summary:**

- Since fall of 2014, MDHHS staff have been working to promote timely case follow up on Legionellosis cases reported to the Genesee County Health Department. Delays in GCHD follow-up have contributed to a lack of complete information, and a lack of appropriate clinical specimens, however, since January, GCHD has accepted MDHHS assistance in the process.
- Approximately one half of the cases have a reported history of exposure that includes one healthcare facility. As would be the appropriate public health recommendation, that facility continues to undergo environmental remediation to address the issue.
- *Legionella* bacteria is ubiquitous in the environment. Since water testing at the source was negative for bio-contaminants, it is possible that other factors influenced the release of biofilms from existing water infrastructure.

Eden & Sue,

I don't know how much information your staff has shared with you about the legionella situation here. MDHHS staff has been informed that we have received a FOIA from an attorney representing one of the positive cases who died. I am sending some info which was already shared with your staff as some background material FYI.

## EXECUTIVE SUMMARY

Special Pathogens Laboratory (SPL) was contacted by McLaren Flint Health Care to assist the hospital in responding to an increase in the incidence of Legionnaires' disease due to *Legionella pneumophila*, serogroup 1. The Genesee County Health Department had also been in contact with the hospital regarding cases of Legionnaires' disease in patients that had been diagnosed and treated at the hospital. This increase in cases had been observed over the past year when water quality in Flint was adversely affected when the city switched from Detroit water to the Flint River last year. SPL was asked to provide consultation services, including an on-site risk assessment, review of the facility's current Legionella policy, and development of a Water Safety Plan for the facility.

Assessments of McLaren Flint Hospital buildings were performed from August 11 – 13, 2015. The assessment including collection of samples for *Legionella* culture from distal hot water sites, distal cold water sites, hot water heaters, a hot water return, and the cold water entries. Physicochemical measurements, including pH, temperature, and free chlorine, were also taken.

*Legionella pneumophila* serogroup 1 was detected across all systems, with the majority of hot water distal sites (water outlets) showing some level of positivity.

McLaren Flint Hospital Administration, Infectious Diseases, Facilities Engineering and Infection Control acted aggressively to address the potential risk for hospital-acquired Legionnaires' disease. Staff worked with SPL to expedite both short and long-term approaches to prevention. This included recommendations for

rapid identification and treatment of cases as well as recommendations regarding options for installation of secondary water treatment (disinfection).

The hospital staff performed a "shock" hyperchlorination disinfection in Buildings F, A, and B/C. The hyperchlorination disinfection for Building F Upper System was completed on August 14-15, 2015 and re-sampled for *Legionella* on August 17, 2015.

The "post-disinfection" culture results showed that *Legionella* concentrations were significantly lower—indicating the hyperchlorination disinfection was a successful short-term remediation which temporarily reduced *Legionella*.

Long-term secondary disinfection with monochloramine was recommended in patient care areas because of its proven efficacy and ability to rapidly reduce *Legionella* in hospital hot water systems. A Water Safety Plan is being developed to provide on-going risk management and to comply with the new ASHRAE 188 *Legionella* standard.

These efforts have resulted in successfully reducing *Legionella* in the hospital water systems. No cases of healthcare-acquired Legionnaires' disease were identified following these measures.

# SPECIAL UPDATE

Over the past several weeks, there has been an increase in the number of Legionella cases throughout Genesee County. Although a clear source for this increase has not been specifically identified, McLaren Flint is taking proactive and precautionary measures to ensure that we are implementing all recommended practices and safety measures in the prevention and elimination of Legionella in the water system at our facility. In this initiative, we are working in partnership with the Genesee County Health Department and have engaged with leading experts in this field.

Beginning Friday, August 14, we are taking the following steps:

1. Adding additional chlorine to our water supply, while still maintaining levels well within safe drinking standards;
2. Providing bottled water for drinking while we are implementing specific measures. Patients will receive bottled water with all meals, and it will also be available on the unit throughout the day. Employees will also have access to bottled water for drinking purposes.
3. Implementing hyperchlorination of our water system to reinforce the routine, twice-a-year hyperchlorination process that was last implemented in April.
4. Continuing surveillance testing of our water to ensure consistent quality standards.

We understand these implementations may interrupt daily routines and appreciate your support as we work together to maintain a healthy environment for our patients, visitors and staff.

As additional resources, we are including with this update information outlining frequently asked questions and facts about Legionella.

***For any further information, please contact  
Infection Control at (810) 342-2290.***

# Frequently Asked Questions about Legionnaires' Disease

## What is Legionnaires' disease?

Legionnaires' disease is a lung infection (pneumonia) caused by a bacterium named *Legionella pneumophila*. The name *Legionella pneumophila* was derived from the original outbreak at the 1976 American Legion Convention in Philadelphia. *Pneumophila* means "lung loving" in Greek.

## Where do *Legionella* bacteria come from?

*Legionella* are natural inhabitants of water and can be detected in rivers, lakes, and streams. The bacteria are commonly found in the water systems of buildings and households, but pose little risk to healthy adults and children. One type of *Legionella* species (*L. longbeachae*) has been found in potting soil.

## What are the most common symptoms?

Legionnaires' disease can have symptoms like many other forms of pneumonia, so it can be hard to diagnose at first. Signs of the disease can include: a high fever, chills, cough, and confusion. Some people may also suffer from muscle aches and headaches. Symptoms usually begin two to 10 or 14 days after being exposed to the bacteria

## Is Legionnaires' disease contagious?

Legionnaires' disease is not contagious. No special precautions, or isolation of the patient is necessary. The disease is transmitted via drinking water not by infected persons. It requires direct exposure to the bacteria – usually by aerosolized water mist that is inhaled or aspiration.

## Who is at greatest risk for contracting Legionnaire's disease?

People at risk for contracting Legionnaires' disease following exposure to water that contains *Legionella* are usually 65 years or older, smokers, patients with chronic lung disease, and those with weakened immune systems. People who have had a bone marrow or solid organ transplant have the greatest risk of contracting *Legionella* pneumonia.

## How is Legionnaires' disease treated?

Many antibiotics are highly effective against *Legionella* bacteria. The two most effective antibiotics are levofloxacin and azithromycin.

## Legionella Facts

1. Legionnaires' disease is a form of bacterial pneumonia caused by the bacteria *Legionella* found in building water systems.
2. *Legionella* bacteria are naturally found in municipal cold water, but can grow in high numbers in warm water after entering a building's hot water system.
3. How much *Legionella* grows depends on the temperature. The ideal temperature range is between 95 and 110 degrees.
4. Brown water events and water pressure changes in pipes can increase *Legionella* in building water systems.
5. Legionnaires' disease causes a small percentage, only about 2 to 5% of the average 600,000 pneumonia cases that require hospitalization each year.
6. Even if the bacteria enter the lungs, either by inhalation or aspiration drinking water or water droplets, the majority of persons exposed won't become ill. The likelihood for illness is greatest for persons with chronic lung disease (smokers, COPD), those taking high dose steroids, diabetics, patients who have had transplants or persons with compromised immune systems, i.e., cancer treatments.
7. Not all antibiotics are effective against Legionnaires' disease. Two that are very effective are levofloxacin or azithromycin.
8. Diagnosis of Legionnaires' disease requires a specific test—urine antigen—which must be ordered by a physician. Cases are often missed when physicians don't consider Legionnaires' disease as a possible illness. It is often not diagnosed and is under reported for these reasons.
9. Rapid diagnosis and effective treatment are key to minimizing the severity of the disease and in preventing mortality.
10. Approaches to preventing exposure of at risk patient populations to *Legionella* bacteria in water include:
  - Using sterile water with equipment such as nasogastric and endotracheal tubes, TEE probes, etc.
  - Providing bottled water for drinking when cases of hospital-acquired Legionnaires' disease have been identified and until after water is treated to control *Legionella*.
  - Since there is no person-to-person spread of *Legionella* bacteria, disease prevention is accomplished by additional treatment of the warm water system to control and prevent the growth of *Legionella*.

All --

The governor's team has given the go ahead. We've adjusted the timeline slightly to issue the press release and post the report at 2:30 p.m. Embargoed stakeholder notifications will now happen at 2 p.m. as outlined below:

2 p.m.

- Send final embargoed release and summary report to:
  - Genesee County Health Department -- GERALYN Lasher
  - Dr. Mona Hannah-Attisha -- GERALYN Lasher
  - Task Force Members -- GERALYN Lasher
  - City of Flint Mayor's Office -- GERALYN Lasher
  - Congress and legislature -- Elizabeth Hertel

2:30 p.m.

- Issue press release and summary report
- Post press release and summary report to MDHHS website newsroom and Flint Water website, [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater)

3 p.m.

- Pitched media interviews with Dr. Eden Wells

Thank you,

Jennifer Eisner

**Subject:** Flint EBL Release & Documents

Good morning, all:

Attached for your review please find the updated press release, communications plan and December summary report regarding elevated blood lead levels in Flint. We are planning to issue the release and post the report today at 2 p.m.

Yesterday, Dave sent over a two questions from the governor. Our team has provided the following responses:

**Do the elevated lead levels stick with a person for life?**

We do see blood lead levels decrease after education takes place and exposure to lead sources is reduced. The purpose of screening children for lead is to identify those with elevated levels. Removing potential sources of lead exposure and ensuring proper nutrition and healthcare leads to decreases in blood lead levels in follow-up testing, which is an important part of case management. Lead has a half-life in blood of approximately 25 days; in soft tissue, about 40 days; and in the non-labile portion of bone, more than 25 years.

**Why do the lead levels spike on a seasonal basis?**

When reviewing historical trend data, the risk of lead exposure is highest during the third quarter of each year – July through September. Seasonal variation is the result of a number of factors including increased exposure to lead in dust and soil in the summer months.

The notifications will be timed as follows:

1:30 p.m.

- Send final embargoed release and summary report to:
  - Genesee County Health Department – GERALYN Lasher
  - Dr. Mona Hannah-Attisha – GERALYN Lasher
  - Task Force Members – GERALYN Lasher
  - City of Flint Mayor's Office – GERALYN Lasher
  - Congress and legislature – Elizabeth Hertel

2 p.m.

- Issue press release and summary report
- Post press release and summary report to MDHHS website newsroom and Flint Water website, [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater)

Please let me know if you have any additional questions, edits or concerns.

Thank you,

Jennifer Eisner

**Cc:** Lasher, GERALYN (DHHS); Eisner, Jennifer (DHHS)  
**Subject:** Re: Summary Data

Hi there ,

I always include water in seasonality issues---agree!. I just did with media just now. Please know that this is a public report being used that is high level--there are surveillance reports we are maintaining by zip and many other factors-we already know about the high risk zip codes, so this report doesn't capture them (but we are tracking them!!! and know where the levels are---)---we can share that with you but was too complicated for public when compiled for a public use report. We were asked to keep it simple. We definitely have zipode level!

Deduplicated by highest level in calendar year.

We know that this may not reflect water---although anecdotally picking up a few children without filters). But, this reporting will be going on long-term--I am telling media that I am primarily interested in what happens in third quarter of every year as well, as Q4 and Q1 will be low due to seasonality.

Can talk by phone if you wish--

---

**Subject:** RE: Summary Data

Eden,

A few questions/comments as I begin to process this info:

1. Of course, because the half life of blood lead is only 20-30 days, blood lead testing done from october on does not accurately reflect the exposure that occurred from the onset of water switch. Very few people based on the media/health advisories were drinking the water and many many more people were being tested as in the past - thus a smaller percentage.
2. So Flint children were determined by their zip code? Was this data geocoded? Neither zip code, nor city of Flint in the address, correlates with flint water.
3. Any chance you also looked more in depth at the two higher risk zip codes (48503 and 48504)?

4. In terms of the first bullet, "people only counted once who had multiple lead levels" - did you use "first time lead" level of a child or "highest" lead" done on a child? As before, just because a child may have a non-elevated first lead does not mean that subsequent lead levels will be non-elevated
5. Lastly, 2014 and 2015 Q3 is concerning and it's unfortunate that the press release statement regarding seasonal variation did not mention the seasonality of lead in water which is well documented and which most likely led to those higher peaks, "Seasonal variation is the result of a number of factors including increased exposure to lead in dust and soil in the summer months."

I'm sure I'll have more questions later. thanks!

**Subject:** Summary Data

This afternoon at 2:30 p.m., the Michigan Department of Health and Human Services will issue the attached press release and summary report detailing the latest data on blood lead levels in Flint.

We wanted to ensure that you also received this information in advance of the press release being issued.

The summary report provides annual historical information on children younger than six years, children between the ages of six and seventeen years and adults tested for lead. It also provides detail on the number of test results for these category groups that have tested above five micrograms per deciliter. The summary report also provides information on the numbers tested and with elevated blood lead levels since the MDHHS Action Plan began in October.

The preliminary data indicates that 30 of 1,361 adults and children tested in Flint since October 1 had elevated blood lead levels.

Thank you,  
Geraldyn

**MDHHS releases latest data outlining blood lead levels in Flint**  
Follow-up care, case management resources continue for families

LANSING, Mich. – Preliminary data indicates that 30 of 1,361 adults and children tested in Flint since October 1 had elevated blood lead levels, according to a report issued today by the Michigan Department of Health and Human Services.

This marks the first summary report on lead testing called for in the state's action plan related to health concerns about Flint's water infrastructure.

"Our goal is to help families reduce their exposure to lead sources," said Dr. Eden Wells, MDHHS chief medical executive. "We have made progress in testing and identifying those with elevated blood lead levels, and the department will continue to work closely with the Genesee County Health Department to reach these families. We will remain diligent in our ongoing outreach and education efforts."

Information comes from tests administered citywide to 1,361 children and adults since October 1. Tests showed that 21 of 969 children age 17 or younger and 9 of 392 adults over the age 18 were identified with elevated blood lead levels.

The report covers test results reported to MDHHS since the state action plan was put in place Oct. 2. It includes the number of tests and number of elevated blood lead levels greater than 5 micrograms per deciliter, and captures both capillary and venous blood tests that have been reported to MDHHS since the beginning of October. People who have had multiple tests are counted only once. Five micrograms per deciliter is the level that the Centers for Disease Control and Prevention considers elevated and triggers health care professional follow up with families.

The full report is posted online at [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater) and will be updated as more data becomes available.

When reviewing historical trend data, the risk of lead exposure is highest during the third quarter of each year – July through September. Seasonal variation is the result of a number of factors including increased exposure to lead in dust and soil in the summer months.

In the third quarter of 2010, 8.3 percent of Flint children 6 and under showed elevated blood lead levels. The figure gradually decreased to 4.1 percent in the third quarter of 2013. During the same months in 2014, the figure increased to 7.5 percent and decreased to 6.4 percent in the third quarter of 2015.

– MORE –

Last month, MDHHS collaborated with the county health department and local partners to distribute educational resources and informational letters to Flint parents regarding lead testing. The state is providing funding for GCHD nurses to work with families when an elevated blood lead level has been detected. During these follow-up visits, nurses coordinate with environmental health investigators to meet with families in their homes to identify lead exposures, address questions and provide water filters. People can be exposed to lead from paint, soil, plumbing and other sources.

MDHHS continues to provide free water filters and replacement cartridges to Flint residents at four locations, including the MDHHS Flint offices and the Genesee County Community Action Resource Department. For a full list of locations and hours of distribution, visit [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater).

To help residents properly install water filters, and to demonstrate how to replace the original when it expires, MDHHS has created an instructional video on its [YouTube channel](#). For updates, visit [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater).

## Blood Lead Level Test Results for Flint Zip Codes 48501-48507

### Genesee County, and the State of Michigan

#### Summary as of November 13, 2015

### Executive Summary

This report is generated by MDHHS to track Blood Lead Level test results in Flint, Michigan.

- Counts on this report include both capillary and venous blood tests. People who have had multiple tests are counted only once per year.
- Since 10/1/2015, an additional 1,361 people have been tested in Flint.
- Continued testing efforts by Genesee County Health Department, MDHHS and local medical personnel have identified 21 children with blood lead levels greater than or equal to 5µg/dL (micrograms per deciliter) since 10/1/2015.
- Three percent of the children younger than 6 years old tested since 10/1/2015 have had blood lead levels greater than or equal to 5µg/dL.
- Additional testing is ongoing. Counts will vary as new results are added.

Incidence of elevated blood lead  $\geq 5$  mcg/dl among children  $< 6$  years of age by quarter, 2010- 2015

Deduplicated by year, retains test during the time period.

\*Data for Q4 2015 are incomplete

\* Data for Quarter 4 of 2015 are incomplete and subject to change

Eden,

I support frequent updates. Mona and her team can continue to do the GIS work and track progress (or lack thereof) in the blood leads. I think that overall, the latest data implies we are on the right track.

We can use the updates to reinforce the importance of using the filters and bottled water that are being provided...

Best Regards,

Marc

Hi Dr. Reynolds,

I just got done with an email with Mona---

This is a general public report that is high level--not a technical report, and was not meant to represent a technical report. This is general information--of course our surveillance program is tracking by zip, Medicaid, locality, etc.

We can discuss further what type of reporting may be useful to a technical audience---as long as not identifiable (some zips have to be suppressed) I don't see why this can't be done (probably not every two weeks like this public one would be)

Warm Regards,

Eden

This is a good start but maybe lacking context . Would GIS software identify clusters ? I am disappointed to see, at this moment , that Dr. Edward's study and Dr. Mona's study which have more granular reporting are given no credence. Is there a reason ?

## Press Release

---

**FOR IMMEDIATE RELEASE:** December 3, 2015

**CONTACT:** Jennifer Eisner, (517) 241-2112

### **MDHHS releases latest data outlining blood lead levels in Flint**

*Follow-up care, case management resources continue for families*

LANSING, Mich. – Preliminary data indicates that 30 of 1,361 adults and children tested in Flint since October 1 had elevated blood lead levels, according to a report issued today by the Michigan Department of Health and Human Services.

This marks the first summary report on lead testing called for in the state's action plan related to health concerns about Flint's water infrastructure.

"Our goal is to help families reduce their exposure to lead sources," said Dr. Eden Wells, MDHHS chief medical executive. "We have made progress in testing and identifying those with elevated blood lead levels, and the department will continue to work closely with the Genesee County Health Department to reach these families. We will remain diligent in our ongoing outreach and education efforts."

Information comes from tests administered citywide to 1,361 children and adults since October 1. Tests showed that 21 of 969 children age 17 or younger and 9 of 392 adults over the age 18 were identified with elevated blood lead levels.

The report covers test results reported to MDHHS since the state action plan was put in place Oct. 2. It includes the number of tests and number of elevated blood lead levels greater than 5 micrograms per deciliter, and captures both capillary and venous blood tests that have been reported to MDHHS since the beginning of October. People who have had multiple tests are counted only once. Five micrograms per deciliter is the level that the Centers for Disease Control and Prevention considers elevated and triggers health care professional follow up with families.

The full report is posted online at [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater) and will be updated as more data becomes available.

When reviewing historical trend data, the risk of lead exposure is highest during the third quarter of each year – July through September. Seasonal variation is the result of a number of factors including increased exposure to lead in dust and soil in the summer months.

In the third quarter of 2010, 8.3 percent of Flint children 6 and under showed elevated blood lead levels. The figure gradually decreased to 4.1 percent in the third quarter of 2013. During the same months in 2014, the figure increased to 7.5 percent and decreased to 6.4 percent in the third quarter of 2015.

Last month, MDHHS collaborated with the county health department and local partners to distribute educational resources and informational letters to Flint parents regarding lead testing. The state is providing funding for GCHD nurses to work with families when an elevated blood lead level has been detected. During these follow-up visits, nurses coordinate with environmental health investigators to meet with families in their

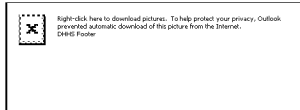

homes to identify lead exposures, address questions and provide water filters. People can be exposed to lead from paint, soil, plumbing and other sources.

MDHHS continues to provide free water filters and replacement cartridges to Flint residents at four locations, including the MDHHS Flint offices and the Genesee County Community Action Resource Department. For a full list of locations and hours of distribution, visit [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater).

To help residents properly install water filters, and to demonstrate how to replace the original when it expires, MDHHS has created an instructional video on its [YouTube channel](#). For updates, visit [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater).

Good morning,

We have a conference line available at 1PM this afternoon. Shall I schedule for 1-2PM?

Thank you,

*Janese Bouters*

Executive Secretary to Corinne Miller  
Bureau of Disease Control, Prevention and Epidemiology  
Michigan Department of Health & Human Services

**Subject:** Re: FOR IMMEDIATE RELEASE: MDHHS releases latest data outlining blood lead levels in Flint; Follow-up care, case management resources continue for families

Hi Mona,

I talked with Corinne just now.....do you still have time at 1? Janese can set up a conference call---

**Subject:** RE: FOR IMMEDIATE RELEASE: MDHHS releases latest data outlining blood lead levels in Flint; Follow-up care, case management resources continue for families

sounds good. as of now, i can talk tomorrow before 8:30am, 1-2pm, or after 3:30pm.

FYI I am working with Hurley Children's, MSU, and maybe the GCHD to create a sort of Pediatric Public Health Collaborative that would house the ongoing assessment/long term followup/research/continued monitoring that we are doing as well as some of the secondary prevention interventions which include all of peds public health. The team will include part of me (30%), research support, epidemiologist, GIS, toxic stress researchers, etc. The reason I wanted to include the health dept was primarily for access to data - like the BLLs - but also to prevent redundancy of interventions. MSU and the health dept already have an academic health dept relationship, but i don't think it includes data sharing.

I like that idea- and I don't foresee an issue with such an agreement. I hope you understand that this is just one form of a surveillance report, and there can be others- but we really wanted to get the testing data started.

Shall we discuss with State Epidemiologist-/could set up call even tomorrow- will share your request with Nick right now

Sent from my iPhone

On Dec 3, 2015, at 6:59 PM, Mona Hanna-Attisha <MHanna1@hurleymc.com> wrote:

Do you think it would be possible to create a data sharing agreement so that we could do the real-time geocoding of kids with EBL's? So whenever a EBL comes in for Genesee county, my team can map it, trend it, etc? You guys may already be doing this, but we easily have the GIS support. This real time mapping will further help us identify hot spots for resource delivery and remediation.

**Subject:** Re: FOR IMMEDIATE RELEASE: MDHHS releases latest data outlining blood lead levels in Flint; Follow-up care, case management resources continue for families

Hi Dr. Reynolds,

I just got done with an email with Mona---

This is a general public report that is high level--not a technical report, and was not meant to represent a technical report. This is general information--of course our surveillance program is tracking by zip, Medicaid, locality, etc.

We can discuss further what type of reporting may be useful to a technical audience---as long as not identifiable (some zips have to be suppressed) I don't see why this can't be done (probably not every two weeks like this public one would be)

Warm Regards,

Eden

**Subject:** Fwd: FOR IMMEDIATE RELEASE: MDHHS releases latest data outlining blood lead levels in Flint; Follow-up care, case management resources continue for families

This is a good start but maybe lacking context . Would GIS software identify clusters ? I am disappointed to see, at this moment , that Dr. Edward's study and Dr. Mona's study which have more granular reporting are given no credence. Is there a reason ?

## Press Release

---

**FOR IMMEDIATE RELEASE:** December 3, 2015

**CONTACT:** Jennifer Eisner, ([517](tel:5172412112)) 241-2112

### **MDHHS releases latest data outlining blood lead levels in Flint**

*Follow-up care, case management resources continue for families*

LANSING, Mich. – Preliminary data indicates that 30 of 1,361 adults and children tested in Flint since October 1 had elevated blood lead levels, according to a report issued today by the Michigan Department of Health and Human Services.

This marks the first summary report on lead testing called for in the state's action plan related to health concerns about Flint's water infrastructure.

"Our goal is to help families reduce their exposure to lead sources," said Dr. Eden Wells, MDHHS chief medical executive. "We have made progress in testing and identifying those with elevated blood lead levels, and the department will continue to work closely with the Genesee County Health Department to reach these families. We will remain diligent in our ongoing outreach and education efforts."

Information comes from tests administered citywide to 1,361 children and adults since October 1. Tests showed that 21 of 969 children age 17 or younger and 9 of 392 adults over the age 18 were identified with

elevated blood lead levels.

The report covers test results reported to MDHHS since the state action plan was put in place Oct. 2. It includes the number of tests and number of elevated blood lead levels greater than 5 micrograms per deciliter, and captures both capillary and venous blood tests that have been reported to MDHHS since the beginning of October. People who have had multiple tests are counted only once. Five micrograms per deciliter is the level that the Centers for Disease Control and Prevention considers elevated and triggers health care professional follow up with families.

The full report is posted online at [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater) and will be updated as more data becomes available.

When reviewing historical trend data, the risk of lead exposure is highest during the third quarter of each year – July through September. Seasonal variation is the result of a number of factors including increased exposure to lead in dust and soil in the summer months.

In the third quarter of 2010, 8.3 percent of Flint children 6 and under showed elevated blood lead levels. The figure gradually decreased to 4.1 percent in the third quarter of 2013. During the same months in 2014, the figure increased to 7.5 percent and decreased to 6.4 percent in the third quarter of 2015.

Last month, MDHHS collaborated with the county health department and local partners to distribute educational resources and informational letters to Flint parents regarding lead testing. The state is providing funding for GCHD nurses to work with families when an elevated blood lead level has been detected. During these follow-up visits, nurses coordinate with environmental health investigators to meet with families in their homes to identify lead exposures, address questions and provide water filters. People can be exposed to lead from paint, soil, plumbing and other sources.

MDHHS continues to provide free water filters and replacement cartridges to Flint residents at four locations, including the MDHHS Flint offices and the Genesee County Community Action Resource Department. For a full list of locations and hours of distribution, visit [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater).

To help residents properly install water filters, and to demonstrate how to replace the original when it expires, MDHHS has created an instructional video on its [YouTube channel](#). For updates, visit [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater).

**Subject:** FW: scanned document

Sorry!!!!!!!!!!!!comment/edit if you can. This is in response to the first task force document.

Bullets 1 & 2 of first draft letter indicate

Bullet 1: MDHHS should set minimum BLL screening goals among Flint children < 6 years of age enrolled in Medicaid at 80% with a more aggressive target of 100 percent. Goals should be monitored weekly and if not met MDHHS should establish progressively intensified screening efforts if goals are not met. Intensified screening efforts should be coordinated with local providers to minimize disruption of children's medical homes to ensure appropriate clinical follow-up.

Response: The MDHHS Medicaid goal for BLL screening among Flint children < 6 years of age is 80%. 80% BLL testing is the first target for this age group. MDHHS met with Medicaid health plans during the week of November 30. Medicaid met with health plan CEOs that same week and a discussion of Flint was placed on the agenda. Dr. Wells participated by telephone in this meeting to describe the situation in Flint and the need for testing. MDHHS Medicaid leadership identified individuals to work with childhood lead poisoning epidemiology staff to develop methods for tracking testing of Flint children enrolled in Medicaid. Due to the data sources, measurement of the 80% goal is set at bi-weekly, not weekly as recommended by the task force. MDHHS developed a Health Alert Network (HAN) message to be distributed to providers after review by the local health department. The HAN recommends testing of any child < 6 in Flint who has not been tested, not only those who are 1 and 2 years of age. Medicaid health plan staff along with MDHHS childhood lead poisoning program staff are planning to host a meeting with Flint health care providers in early 2016. MDHHS will involve Flint-based primary care providers in the meeting planning to assure the meeting as a focus that represents community needs.

Bullet 2: Broaden blood lead level testing among infants (under 12 months of age in Flint), especially those infants living in high risk Zip codes. The most appropriate partners for this effort are primary care providers and WIC clinics.

Response: The HAN mentioned above particularly requests testing of infants in Flint. In addition, testing of this age group will be on the meeting agenda mentioned above. Testing of infants will be looked at separately in the metrics developed by the Medicaid and childhood lead poisoning epidemiology workgroup. In addition, the WIC program is committed to assuring that the youngest children are protected and will work closely with the MDHHS childhood lead poisoning project on messaging. The Medicaid and childhood lead poisoning workgroup will set a metric to the degree possible that identifies proportions of Flint infants in WIC who have been tested for elevated blood lead levels.

**Importance:** High

As Sue indicates below, we'll likely receive something similar to the attached letter from the Task Force. Director Lyon would like a prepared response by Monday...which means we need to have drafts done by COB tomorrow (Friday 12/4/15).

Sue suggested we prepare responses to the final set of bullets on pages 2 and 3, and staff that can best respond as follows:

- Bullets 1 and 2, Corinne with help from Sue and Eden
- Bullet 3, Nancy Peeler for the case management response portion and myself for the EBL Env. Portion.
- Bullet 4, Michelle and I can describe our communication efforts
- Bullets 5 and 6, all me
- Bullet 7, Nancy Peeler

Sue, please correct if I didn't get this right.

**To:** Dykema, Linda D. (DHHS); Miller, Corinne (DHHS)

**Cc:** Wells, Eden (DHHS)

**Subject:** FW: scanned document

Heads Up: this is draft of letter that will likely be sent to MDHHS in the next day or so—it includes a number of recommendations from the Flint Water Advisory Task Force. We will need to respond the letter, and that effort will likely need to include input from several on the Flint Water Project Team- will ask Linda to coordinate the drafting of the response letter.

FYI: Eden and I have a call later today with Matt Davis- Matt has advocated for a number of actions including activating the “Division of Emergency Preparedness and Response”. In our call today, we would like to update Matt on actions we have implemented or in process.

**Subject:** scanned document

Here you go.

## **Intensified Screening Efforts for Children on Medicaid**

It is well established from studies conducted during the 1980s and 1990s that children eligible for Medicaid are at increased risk for lead exposure and that children living in poverty have higher levels of lead exposure than those who were not living in poverty. The primary purpose of childhood blood lead screening is to identify asymptomatic children with Elevated Blood Lead Levels (EBLL) so that they can promptly receive services to reduce lead exposure and improve health outcomes.

**Regarding Bullet 1 of Governor's Task Force Draft Letter:** MDHHS should set minimum BLL screening goals among Flint children < 6 years of age enrolled in Medicaid at 80% with a more aggressive target of 100 percent. Goals should be monitored weekly and if not met MDHHS should establish progressively intensified screening efforts if goals are not met. Intensified screening efforts should be coordinated with local providers to minimize disruption of children's medical homes to ensure appropriate clinical follow-up.

**Response:** The MDHHS Medicaid goal for BLL screening among Flint children < 6 years of age is 80%. 80% BLL testing is the first target for this age group. MDHHS met with Medicaid health plans during the week of November 30. Medicaid met with health plan CEOs that same week and a discussion of Flint was placed on the agenda. Dr. Wells participated by telephone in this meeting to describe the situation in Flint and the need for testing. MDHHS Medicaid leadership identified individuals to work with childhood lead poisoning epidemiology staff to develop methods for tracking testing of Flint children enrolled in Medicaid. Due to the data sources, measurement of the 80% goal is set at bi-weekly, not weekly as recommended by the task force. MDHHS developed a Health Alert Network (HAN) message to be distributed to providers after review by the local health department. The HAN recommends testing of any child < 6 in Flint who has not been tested, not only those who are 1 and 2 years of age. Medicaid health plan staff along with MDHHS childhood lead poisoning program staff are planning to host a meeting with Flint health care providers in early 2016. MDHHS will involve Flint-based primary care providers in the meeting planning to assure the meeting as a focus that represents community needs.

**Bullet 2: Broaden blood lead level testing among infants (under 12 months of age in Flint), especially those infants living in high risk Zip codes. The most appropriate partners for this effort are primary care providers and WIC clinics.**

**Response:** The HAN mentioned above particularly requests testing of infants in Flint. In addition, testing of this age group will be on the meeting agenda mentioned above. Testing of infants will be looked at separately in the metrics developed by the Medicaid and childhood lead poisoning epidemiology workgroup. In addition, the WIC program is committed to assuring that the youngest children are protected and will work closely with the MDHHS childhood lead poisoning project on messaging. The Medicaid and childhood lead poisoning workgroup will set a metric to the degree possible that identifies proportions of Flint infants in WIC who have been tested for elevated blood lead levels.

## ENGAGEMENT OF COMMUNITY PROVIDERS< HEALTH PLANS AND THEIR PROVIDERS TO ENHANCE TESTING

Dr. Wells, Chief Medical Executive, has been working with local pediatrician, Dr. Mona Hanna-Attisha and Dr. Larry Reynolds, among others, to ensure that provider issues and concerns are being addressed.

- Dr. Hanna-Attisha has been part of the groups developed initial provider and parent letters to the community in October 2015.
- Dr. Wells has met with Dr. Dean Sienko, Dean of the MSU School of Public Health and MSU leaders along with Dr. Mona Hanna-Attisha and Marc Edwards to brainstorm aon community-based efforts needed to address the event, as well as to discuss potential studies necessary to monitor health impacts and community needs.
- Dr. Wells serves on the Mayor's Technical Advisory Committee, as well as the weekly Mayor's meeting with MDEQ and MDHHS(along with Lind a Dykema from MDHHS Division of Environmental Health).
- Dr. Wells has addressed a number of issued form the Genesee County Board of Health regarding concerns regarding pregnant women, breast-feeding and people with Wilson's Disease.

## HEALTH ALERT AND PROVIDER LETTER

*Michigan Medicaid Early Periodic Screening, Diagnosis and Treatment (EPSDT) guidelines require children to be tested for blood lead poisoning at 12 months and 24 months, and between the ages of 36-72 months if not previously tested (<http://www.mdch.state.mi.us/dch-medicare/manuals/MedicaidProviderManual.pdf>). Due to the enhanced public health issue of an increased risk for lead exposure in the City of Flint, providers have been advised to follow enhanced guidelines for lead testing in children:*

- *Providers should screen ALL children (regardless of Medicaid/insurance status) aged 0-6 years of age exposed to Flint city drinking water after April 2014. Note: this includes all children younger than 1 year and children between the ages of 3-6 years.*
- *If the child has already been screened within the time period of April 2014-present by a capillary test, healthcare providers should follow-up on any elevated levels >5mcg/dl to ensure confirmatory venous testing is conducted.*
- *Utilize the standard Blood Lead Level (BLL) Quick Reference for Primary Care Providers at [http://www.mi.gov/documents/deq/ProviderQuickReference\\_Sept2015\\_501831\\_7.pdf?20151204122739](http://www.mi.gov/documents/deq/ProviderQuickReference_Sept2015_501831_7.pdf?20151204122739)*
- *All clients with blood lead levels greater than 5mcg/dl should be referred for case management coordinated through Genesee County Health Department.*
- *Providers should inquire about use of a drinking water filter and/or bottled water in all clients residing in city limits.*

- *Healthcare providers should inquire about other potential sources of lead in the household per current recommendations (see: [https://www.michigan.gov/documents/mdch/testing-screening071009\\_287511\\_7.pdf](https://www.michigan.gov/documents/mdch/testing-screening071009_287511_7.pdf))*

The majority of children living in Flint exposed to Flint water supply have Medicaid as their source of health care coverage and are enrolled in one of the 8 Medicaid Health Plans that serve enrollees in Genesee County. Partnering with Medicaid Health Plans to accelerate lead testing efforts is a key strategy to increase the reach of blood lead testing in children 1-5 years of age. The Chief Medical Executive, Dr. Eden Wells, recently highlighted this imperative at a meeting with the Chief Executive Officers of the Medicaid Health Plans and the MDHHS Medicaid Director and his senior leadership team. The information outlined above will be sent to all hospitals and healthcare providers in Flint via Blast Fax and the Health Alert Network system. Other provider liaison activities include the following:

Further, a technical workgroup comprised of Medicaid data analytic and public health surveillance experts are meeting to develop Medicaid specific EBL dashboard that will be utilized to measure an overall progress in blood lead testing of 1-5 year olds.

[dykemaL@michigan.gov](mailto:dykemaL@michigan.gov)

The Michigan Department of Health and Human Services (MDHHS) is in receipt of the letter dated [date] that conveys the recommendations of the Flint Water Advisory Task Force. This response provides MDHHS' proposed plans to implement and internally coordinate our response to the elevated levels of lead in the Flint water supply and the resulting concerns regarding elevated blood lead levels in city of Flint residents, particularly children under the age of six years who are most vulnerable to the harmful effects of exposure to lead.

The resources and expertise to respond to the Flint drinking water concerns resides within the MDHHS Population Health & Community Services Administration (PHCSA), which has implemented a Flint Water Lead Project organizational structure to manage project activities. The structure retains our current management chain with Susan Moran in the lead for PHCSA and Dr. Corinne Miller as the lead for the Bureau of Disease Control, Prevention and Epidemiology (BDCPE). Dr. Linda Dykema, Division of Environmental Health Director, has been designated as the Project Manager and liaison to Michigan Department of Environmental Quality (MDEQ). Dr. Eden Wells, MDHHS Chief Medical Executive, is designated as the liaison to all other stakeholders including the medical community in the city of Flint. Director Nick Lyon maintains overall accountability for the MDHHS Flint Water Action Plan, and GERALYN Lasher is the point of contact for communications with the Governor's office.

The organization structure further designates MDHHS staff as leaders for specific activities that include: promoting and increasing blood lead testing for city of Flint residents, case management services by nurses trained to provide education and assistance to families of Flint children with elevated blood lead levels, environmental investigation services to test household water and identify other sources of lead exposure in city of Flint homes, and the distribution of drinking water filters and replacement cartridges to city of Flint residents. In addition, the organizational structure includes experts in public health outreach and communication, toxicology, and epidemiological surveillance to ensure that we are monitoring the numbers of Flint residents tested and providing information and assistance to those with elevated blood lead levels.

#### **Intensified Screening Efforts for Children on Medicaid**

It is well established from studies conducted during the 1980s and 1990s that that children eligible for Medicaid are at increased risk for lead exposure and that children living in poverty have higher levels of lead exposure than those who were not living in poverty. The primary purpose of childhood blood lead screening is to identify asymptomatic children with Elevated Blood Lead Levels (EBLL) so that they can promptly receive services to reduce lead exposure and improve health outcomes.

**Bullet 1 of Governor's Task Force Draft Letter: MDHHS should set minimum blood lead level (BLL) screening goals among Flint children < 6 years of age enrolled in Medicaid at 80 percent with a more aggressive target of 100 percent. Goals should be monitored weekly and if not met MDHHS should establish progressively intensified screening efforts if goals are not met. Intensified screening efforts should be coordinated with local providers to minimize disruption of children's medical homes to ensure appropriate clinical follow-up.**

**Response:** The MDHHS Medicaid goal for BLL screening among Flint children less than 6 years of age is 80%. 80% BLL testing is the first target for this age group. MDHHS met with Medicaid health plans during the week of November 30, 2015. Medicaid met with health plan CEOs that same week and a discussion of Flint was placed on the agenda. Dr. Eden Wells participated by telephone in this meeting to describe the situation in Flint and the need for testing. MDHHS Medicaid leadership identified

individuals to work with childhood lead poisoning epidemiology staff to develop methods for tracking testing of Flint children enrolled in Medicaid. Due to the data sources, measurement of the 80% goal is set at bi-weekly, not weekly as recommended by the task force. MDHHS developed a Health Alert Network (HAN) message to be distributed to providers after review by the local health department. The HAN recommends testing of any child less than six years of age in Flint who has not been tested, not only those who are one and two years of age. Medicaid health plan staff along with MDHHS childhood lead poisoning program staff are planning to host a meeting with Flint health care providers in early 2016. MDHHS will involve Flint-based primary care providers in the meeting planning to assure the meeting as a focus that represents community needs.

**Bullet 2 of Governor's Task Force Draft Letter: Broaden blood lead level testing among infants (under 12 months of age in Flint), especially those infants living in high risk Zip codes. The most appropriate partners for this effort are primary care providers and WIC clinics.**

**Response:** The HAN mentioned above particularly requests testing of infants in Flint. In addition, testing of this age group will be on the meeting agenda mentioned above. Testing of infants will be looked at separately in the metrics developed by the Medicaid and childhood lead poisoning epidemiology workgroup. In addition, the WIC program is committed to assuring that the youngest children are protected and will work closely with the MDHHS childhood lead poisoning project on messaging. The Medicaid and childhood lead poisoning workgroup will set a metric to the degree possible that identifies proportions of Flint infants in WIC who have been tested for elevated blood lead levels.

#### **ENGAGEMENT OF COMMUNITY PROVIDERS, HEALTH PLANS AND THEIR PROVIDERS TO ENHANCE TESTING**

Dr. Wells is working with local pediatrician, Dr. Mona Hanna-Attisha and Dr. Larry Reynolds, among others, to ensure that provider issues and concerns are being addressed.

- Dr. Hanna-Attisha assisted in the development of initial provider and parent letters to the community in October 2015.
- Dr. Wells met with Dr. Dean Sienko, Dean of the Michigan State University (MSU) School of Public Health and MSU leaders along with Dr. Mona Hanna-Attisha and Marc Edwards to brainstorm on community-based efforts needed to address the event, as well as to discuss potential studies necessary to monitor health impacts and community needs.
- Dr. Wells and Dr. Dykema serve on the Mayor's Technical Advisory Committee, as well as the weekly Mayor's meeting that includes MDHHS, MDEQ, and LARA.
- Dr. Wells has addressed a number of issues from the Genesee County Board of Health regarding concerns regarding pregnant women, breast-feeding and people with Wilson's-Disease.

[This is the draft text of the HAN, not sure where you want this or whether to include]

#### **HEALTH ALERT AND PROVIDER LETTER**

*Michigan Medicaid Early Periodic Screening, Diagnosis and Treatment (EPSDT) guidelines require children to be tested for blood lead poisoning at 12 months and 24 months, and between the ages of 36-72 months if not previously tested (<http://www.mdch.state.mi.us/dch-medicare/manuals/MedicaidProviderManual.pdf>). Due to the enhanced public health issue of an increased risk for lead exposure in the City of Flint, providers have been advised to follow enhanced guidelines for lead testing in children:*

- Providers should screen ALL children (regardless of Medicaid/insurance status) aged 0-6 years of age exposed to Flint city drinking water after April 2014. Note: this includes all children younger than 1 year and children between the ages of 3-6 years.
- If the child has already been screened within the time period of April 2014-present by a capillary test, healthcare providers should follow-up on any elevated levels >5mcg/dl to ensure confirmatory venous testing is conducted.
- Utilize the standard Blood Lead Level (BLL) Quick Reference for Primary Care Providers at [http://www.mi.gov/documents/deq/ProviderQuickReference\\_Sept2015\\_501831\\_7.pdf?20151204122739](http://www.mi.gov/documents/deq/ProviderQuickReference_Sept2015_501831_7.pdf?20151204122739)
- All clients with blood lead levels greater than 5mcg/dl should be referred for case management coordinated through Genesee County Health Department.
- Providers should inquire about use of a drinking water filter and/or bottled water in all clients residing in city limits.
- Healthcare providers should inquire about other potential sources of lead in the household per current recommendations (see: [https://www.michigan.gov/documents/mdch/testing-screening071009\\_287511\\_7.pdf](https://www.michigan.gov/documents/mdch/testing-screening071009_287511_7.pdf))

The majority of children living in Flint exposed to Flint water supply have Medicaid as their source of health care coverage and are enrolled in one of the Medicaid Health Plans that serve enrollees in Genesee County. Partnering with Medicaid Health Plans to accelerate lead testing efforts is a key strategy to increase the reach of blood lead testing in children 1-5 years of age. The Chief Medical Executive, Dr. Eden Wells, recently highlighted this imperative at a meeting with the Chief Executive Officers of the Medicaid Health Plans and the MDHHS Medicaid Director and his senior leadership team. The information outlined above will be sent to all hospitals and healthcare providers in Flint via Blast Fax and the Health Alert Network system. Other provider liaison activities include the following:

Further, a technical workgroup comprised of Medicaid data analytic and public health surveillance experts are meeting to develop Medicaid specific EBL dashboard that will utilized to measure an overall progress in blood lead testing of 1-5 year olds.

**Comment [MS(1):** Is there supposed to be a list here?

**Bullet 3 of Governor's Task Force Draft Letter: Enhance follow up for children found to have blood lead levels  $\geq 5$  micrograms per deciliter. The increased case management capacity in Flint that has been implemented to date is a promising first step. This must be accompanied by assiduous implementation of the follow-up programs, to maximize the rate of follow up testing for children known to have had elevated lead levels and to optimize the in-home remediation for each child.**

**Response:** MDHHS has established a contract with the Genesee County Health Department (GCHD) to provide Case Management services for children identified with elevated capillary or venous samples that were drawn after April 1, 2014. To date, GCHD has hired 2.5 FTE, with a third 1.0 FTE position posted. The current GCHD Case Management staff have received training, and are implementing an updated Case Management protocol that was modified to reflect the circumstances in Flint (added components related to water and filters). They are working closely with the contractors that will be providing the Elevated-Blood Lead level (EBL) investigations to facilitate their link to the families.

As of December 4, 2015, the Genesee County Health Department has attempted to establish contact with the families of all 171 children identified with elevated capillary or venous samples that were drawn after April 1, 2014. The GCHD has successfully contacted the families of 40% of these children. To date, ten families have accepted the offer of services and received visits, with another six visits

pending in the upcoming week. In addition, MDHHS has arranged for services in other counties for 3 families (4 children) who have re-located to those other counties.

MDHHS holds weekly status calls with the GCHD Case Management staff; those calls have thus far focused on initial implementation of the Case Management services. With implementation underway, we are now in a position to shift the focus to monitoring the outcomes, and begin to identify and implement improvements to find more families, work with more families, and deliver more services. We will adopt a Continuous Quality Improvement framework to support this work. In collaboration with GCHD staff, we have begun to analyze the barriers and challenges they are finding as they offer services to families. Next steps will be to review these challenges with our internal team to identify any policy or practices at the state level that can be clarified or modified to support greater success. Simultaneously, the GCHD staff are discussing these challenges internally, and identifying where they believe improvements can be made. We have an in-person meeting scheduled in December to review findings and discuss next steps. We anticipate that this cycle of analysis and improvement will continue on a regular basis, and we will monitor the Case Management data to assess whether the steps we are taking are yielding results.

The MDHHS Lead Safe Homes Program has entered into a contract with Michigan-based Environmental Testing & Consultants (ETC) to conduct an elevated blood level (EBL) environmental home inspection in every home of a Flint child with an elevated blood lead level, if the family allows the inspection. The Lead Safe Homes program staff overseeing the contract communicate almost daily with ETC and the GCHD Case Management staff to coordinate home visits with the goal of inconveniencing the families as little as possible while providing comprehensive outreach and services.

The purpose of the investigation is to identify all probable causes of the lead poisoning in order to protect the child from further exposure and physical harm. The scope of the investigation will focus on all sources of lead in the child's environment, including drinking water, dust and soil, as well as household items (i.e., ceramics, cultural/medicinal remedies, occupational take-home sources), and other places the child frequents such as day-care and other family members' homes. An extensive interview with the child's primary caretaker is conducted to take into account the child's behavior and other occupant use patterns.

At the conclusion of the EBL environmental investigation, ETC will develop an EBL Report of their findings and recommendations, which is provided to both MDHHS and the family. Every family will be provided with the application for the Lead Safe Homes program and if they qualify, the EBL Report will be used to guide abatement activities in that home. Some typical abatement activities include replacing doors and windows (a common source of lead-paint dust), encapsulating lead-based paint, and covering or removing lead-contaminated soil. Some sources of abatement funds (e.g., the U.S. Department of Housing and Urban Development) do not allow grant funding to be used to replace household plumbing components.

Services provided to each EBL child in Flint will be tracked by MDHHS staff to ensure families are offered all possible opportunities to avail themselves of the assistance provided by local and state agencies.

**Bullet 4 of Governor's Task Force Draft Letter: Establish stronger communication with throughout the Flint community about the risks of lead in the environment for children, and to explain the steps that are being taken and how the community can participate. Such communication would also help address misconceptions about contaminated water in Flint (i.e., there are anecdotal reports that some**

**residents are discontinuing use of filters even though the water sources have not yet been established as safe) and sustain communication from the public health authorities going forward.**

**Response:** Since early in October 2015, MDHHS has been closely working with the Genesee County Health Department (GCHD) to find scientifically-defensible answers to the questions of the community, and communicate those answers in clear and simple terms. As the boots-on-the-ground representatives, employees of GCHD have been attending meetings and giving presentations on the lead in water issue and are greatly in tune with the needs of the community – from questions about safe uses of water for children, adults, and pets to proper use and efficacy of filters and replacement cartridges to limit lead exposure to health effects of lead for both children and adults, including an explanation as to why children are at higher risk from lead. In addition, MDHHS is working with GCHD to anticipate and preempt questions that may arise in the future – including topics as the addition of extra phosphates to Flint water and the potential health implications related this.

Fact sheets developed in partnership with Genesee County Health Department since October include:

- **FAQs: Lead in Flint Water** – this document details when one should use filtered water versus unfiltered water. Available at: [http://www.michigan.gov/documents/deq/2015-10-21\\_-\\_Lead\\_-\\_Flint\\_Water\\_FINAL\\_504265\\_7.pdf?20151207171149](http://www.michigan.gov/documents/deq/2015-10-21_-_Lead_-_Flint_Water_FINAL_504265_7.pdf?20151207171149)
- **FAQs: Lead and Your Body** – this document explains the potential health effects of lead poisoning through all life stages, and includes information about exposure pathways of lead from water. Available at: [http://www.michigan.gov/documents/deq/2015-10-28\\_-\\_Lead\\_and\\_your\\_Body\\_-\\_Flint\\_-\\_no\\_background\\_507727\\_7.pdf?20151207171149](http://www.michigan.gov/documents/deq/2015-10-28_-_Lead_and_your_Body_-_Flint_-_no_background_507727_7.pdf?20151207171149)
- **Adding Phosphates to Flint Water** – this document explains the process by which adding extra phosphates can potentially reduce the lead levels in Flint homes' water and the health implications of the phosphates at the levels they're being added. Approved for publication by GCHD, MDHHS approval and posting pending.
- **Aerator Cleaning/Filter Maintenance Fact Sheet** – research for this document is underway by MDHHS. Questions regarding the efficacy of the filters to remove lead at the levels found in some Flint homes and the potential effect of additional phosphates on the filter's ability to function, amongst other similar topics are being researched.

In addition, MDHHS is developing a Lead-Safe Family Guidebook that will be provided to families in conjunction with case management and environmental investigations services. The guidebook will also be available to the general public as a one-stop resource to prevent lead exposure in their homes.

The Guidebook will assist families in understanding the report that they receive at the completion of their home's lead investigation. This stand-alone report is a technical, scientific document which can be daunting for anyone – let alone a family who is facing the unexpected reality that their child has been exposed to lead. A nurse case manager will walk the families through the report using the companion guide to explain in plain language what the technical report means and what follow-up steps the families can do to remediate the situation.

**Bullet 5 of Governor's Task Force Draft Letter: In coordination with MDEQ, establish a plan for repeated testing of tap water and other sources of lead in the homes of children known to have**

**elevated blood lead levels, to maximize the case management response conducted at this time by community health nurses. This plan should also consider testing tap water and other sources of lead in the homes of children who have not been tested for blood lead, in order to broaden testing to identify children at risk.**

**Bullet 6 of Governor's Task Force Draft Letter: In coordination with MDEQ, establish a plan for repeated testing of water available in Flint city elementary schools via water fountains and taps.**

Dr. Linda Dykema is designated within the Flint Water Lead Project organization structure as the liaison to the MDEQ. She and her staff have worked with the MDEQ Office of Drinking Water and Municipal Assistance (ODWMA) in the development of drinking water testing protocols for city of Flint schools and private homes. The household drinking water testing protocol developed through these joint efforts is being implemented by ETC contractors as part of the EBL environmental investigation and the MDEQ laboratory is analyzing all water samples collected in these efforts.

Dr. Dykema consults weekly with ODWMA and Department of Licensing and Regulatory Affairs (LARA) staff to resolve problems that arise in the implementation of testing protocols, to convey test results as they become available, and to identify recommendations for abatement activities. Dr. Dykema and her staff remain available to MDEQ and LARA to assist on further efforts to reduce exposure to lead in Flint drinking water.

**Bullet 7: Establish a long-range (i.e., 1-year, 3-year, 5-year) plan for clinical follow up of children known to have had elevated blood lead levels in this time period in Flint, including consideration of the role of neurodevelopment testing and readiness for preschool and kindergarten learning environments.**

MDHHS has scheduled a meeting with the Office of Great Start to establish a plan related to developmental supports and services for children in Flint. We anticipate that the two agencies will review currently available programs and services through each agency, identify gaps, and identify potential funding streams and evidence-based approaches that will best support children's continued growth, development, and learning.

**Subject:** RE: Action items from yesterday's call

Thank you for the summary. Thank you for the opportunity to follow up our conversations of earlier this year. As we expressed, we have other water related concerns beyond Legionella. We previously discussed skin rashes, gastrointestinal illness, and TTHM. We are now addressing lead and phosphate and want to be prepared for new concerns as they present themselves.

I want to share that I received an email today from Marc Edwards of Virginia Tech. They have detected very high levels of Legionella in two large buildings they have tested. He did not name them or the type of building. We are following up.

We will also be following up with you for additional resources.

Thank you again for the opportunity to express our concerns. We need access to all resources available to us.

Suzanne

**Subject:** Action items from yesterday's call

Hi all,

Thanks for your participation on the call yesterday. To sum up, we think we agreed:

--The state and county health departments will work together to analyze the epi data around the increase in Legionnaires' disease cases to determine whether any additional interventions may be needed. They will contact CDC's Respiratory Diseases Branch for any additional subject matter expertise as needed. The state is comfortable with the county reaching out directly to CDC, but would like to be included in the communication.

--EPA will work directly with the county health department through the existing EPA task force to provide technical expertise related to community water systems as it applies to the Legionnaires' disease investigation as well as other diseases of concern.

--CDC's Environmental Health Services Branch and Waterborne Diseases Prevention Branch are available as needed for additional subject matter expertise involving other concerns related to water quality or communication about waterborne disease prevention. NCEH/EHSB will respond to the request from Genesee County for information on the 10 Essential Services of Environmental Health.

We were happy to hear that the message of prevention through establishing a water management plan (ASHRAE 188) has gotten out to the hospitals, and encourage the county to stay engaged with how this is working. We would appreciate hearing any feedback regarding the implementation of ASHRAE 188. We also encourage communication with other building owners to bring awareness and implementation of ASHRAE 188 in other healthcare and non-healthcare settings.

Please let us know if you have any modifications to these action items.

Best regards,  
Laurel

<b>PPI</b>
------------

Here is a proposed agenda...feel free to weigh in on other items we should discuss.

**Specific to Legionnaires' disease:**

- What type of assistance (if any) is being requested? (State and County HD)
- What is the role of EPA and what assistance has been provided so far? (EPA)
- What is the role of ATSDR and what assistance has been provided so far? (ATSDR)
- If additional federal assistance is needed, what can CDC offer? (CDC)

Thanks everyone!  
Laurel

Justification of the drinking water “no corrective action” lead level for use in the Flint school and daycare  
drinking water sample decision tree

The Michigan Department of Health and Human Services (MDHHS) requested that the Toxic Steering Group (TSG) provide endorsement of a health-based drinking water lead level that would require “no corrective action” to put back into service drinking water faucets and fountains used by Flint school and daycare children. Selection of the “corrective actions” was not included in the charge question and is not discussed in this document. A TSG subcommittee was convened to examine this issue. Subcommittee members included Deb Mackenzie-Taylor (Michigan Department of Environmental Quality [MDEQ]), Robert Sills (MDEQ), Eric Wildfang (MDEQ), Jennifer Gray (MDHHS), Christine Flaga (MDEQ), and Kory Groetsch (MDHHS).

Neither the Centers for Disease Control and Prevention’s Agency for Toxic Substances and Disease Registry (ATSDR) nor the U.S. Environmental Protection Agency (EPA) have derived toxicity endpoints (e.g. reference dose, minimal risk level) for lead to be used in risk assessments. Both agencies have stated that no blood lead level has been found to be safe and precautionary actions to reduce exposure to lead, such as running tapwater briefly before use, should always be followed. Due to the pharmacokinetic data and initial acceptable blood lead, the EPA developed a biokinetic model for evaluating lead exposure from multiple media. Lead levels in air, soil, house dust, diet, drinking water, and maternal blood are used to estimate geometric mean blood lead levels for a population of children and the probability that a child would be above a specified blood lead level<sup>1</sup>. The model results are compared to an EPA population health protection goal for young children exposed to lead at residential properties of 5% or lower risk of a child having a blood level greater than the CDC reference value of 5 micrograms lead per deciliter blood ( $\mu\text{g}/\text{dL}$ )<sup>2</sup>. The model, however, does not include inputs to account for direct paint chip ingestion and assumes that children are not exposed to elevated lead in soil and house dust from lead based paint.

Use of the EPA’s Integrated Exposure Uptake Biokinetic (IEUBK) Model

The EPA’s Integrated Exposure Uptake Biokinetic (IEUBK) Model for Lead in Children version 1.1 Build 11 was used to evaluate exposure to children one year old or younger and children seven years old or younger. Default values were retained unless otherwise noted below. See Table 2-1 in the “User’s Guide for the Integrated Exposure Uptake Biokinetic Model for Lead in Children (IEUBK) Windows<sup>®</sup>” for the listing of all the default values<sup>3</sup>. Values selected that are more appropriate for a Michigan urban area, Flint, are described briefly below.

---

<sup>1</sup> The modeling output includes the percent of children in a population that are above a specified blood lead level, but that value can also be viewed as the probability (risk) that a certain child would be above the specified blood lead level.

<sup>2</sup> As stated on the EPA’s Lead at Superfund Sites: Frequent Questions from Risk Assessors on the Integrated Exposure Uptake Biokinetic (IEUBK) Model webpage, found at <http://www2.epa.gov/superfund/lead-superfund-sites-frequent-questions-risk-assessors-integrated-exposure-uptake#mean>.

<sup>3</sup> The model itself and documentation, including the user’s guide for the model can be found at <http://www2.epa.gov/superfund/lead-superfund-sites-software-and-users-manuals>.

### *Air data*

MDEQ performs monitoring for lead in ambient air (as measured in Total Suspended Particulates; lead [TSP]) at a number of fixed stations in Michigan. Some of these monitoring stations (e.g., in Belding, Port Huron, and Vassar) were established to intentionally capture the influence of specific nearby industrial emissions, while others were established to provide data reflecting the general ambient air lead levels in urban areas. The TSG Subcommittee reviewed the ambient air monitoring data, focusing on urban ambient air lead data that would be representative of contemporary Flint conditions. The most recent MDEQ annual air monitoring report is for 2014<sup>4</sup>. The summary statistics provided in the MDEQ annual air quality reports include 3-month average (mean) levels, the highest value (24-hour sample), and the 2<sup>nd</sup> highest value (24-hour sample). The National Ambient Air Quality Standard (NAAQS) for lead (0.15 micrograms per cubic meter [ $\mu\text{g}/\text{m}^3$ ]) has a 3-month averaging time.

Ambient air lead was monitored by MDEQ in Flint (Whaley Park; 3610 Iowa Ave.) until early 2007. The 2005 calendar quarter arithmetic mean values were 0.008, 0.010, 0.011, and 0.012  $\mu\text{g}/\text{m}^3$ . The 2006 calendar quarter arithmetic mean values were 0.005, 0.007, 0.012, and 0.006  $\mu\text{g}/\text{m}^3$ . Although Flint data more recent than 2007 are not available, MDEQ staff considered other urban lead monitoring sites to be fairly representative of Flint conditions. Grand Rapids, Allen Park, and Dearborn each had a highest rolling 3-month arithmetic mean lead (TSP) level of 0.01  $\mu\text{g}/\text{m}^3$  in 2013; for 2014, these values were 0.01  $\mu\text{g}/\text{m}^3$  for Grand Rapids and Allen Park and 0.02  $\mu\text{g}/\text{m}^3$  for Dearborn. These data indicate that the IEUBK model default value of 0.1  $\mu\text{g}/\text{m}^3$  is not the most appropriate air lead level for Flint, and support a representative value of 0.01  $\mu\text{g}/\text{m}^3$  for the air data model input assumption. While a slightly higher air lead level was obtained for Dearborn, the small difference between 0.01 and 0.02  $\mu\text{g}/\text{m}^3$ , would not impact model outputs.

### *Water consumption*

The default drinking water intakes are age-dependent and based on national averages<sup>5</sup>. These were updated to match the mean drinking water intakes (direct and indirect) in Table 3-1 from the U.S. EPA Exposure Factors Handbook: 2011 Edition<sup>6</sup>.

- 0-1 years old - 0.32 liter/day (L/d) (age-adjusted from the values in Table 3-1)
- 1-2 years old - 0.271 L/d
- 2-3 years old - 0.317 L/d
- 3-4 years old - 0.327 L/d (3 to 6 years old in Table 3-1)
- 4-5 years old - 0.327 L/d (3 to 6 years old in Table 3-1)

---

<sup>4</sup> The MDEQ 2014 Annual Air Quality Report can be found at [http://www.michigan.gov/documents/deq/deq-aqd-amu-2014\\_Annual\\_Air\\_Quality\\_Report\\_492732\\_7.pdf?20151014123800](http://www.michigan.gov/documents/deq/deq-aqd-amu-2014_Annual_Air_Quality_Report_492732_7.pdf?20151014123800).

<sup>5</sup> Per the “User’s Guide for the Integrated Exposure Uptake Biokinetic Model for Lead in Children (IEUBK) Windows®”, “The default consumption rates are age-dependent and based on national averages. These consumption rates should be changed only when valid site-specific monitoring data is available.”

<sup>6</sup> The U.S. EPA Exposure Factors Handbook: 2011 Edition can be found at <file:///C:/Users/gravi/Downloads/EFH-COMPLETE.PDF>.

- 5-6 years old - 0.327 L/d (3 to 6 years old in Table 3-1)
- 6-7 years old - 0.414 L/d (6 to 11 years old in Table 3-1)

#### *Drinking water data for alternate drinking water sources*

The alternate drinking water sources used for these modeling runs are listed below with a brief description.

- “Percent of Total Consumed as First Draw” – This value applies to household tap water. This was set to 0% as Genesee County issued a Public Health Emergency Advisory<sup>7</sup> recommending that no one drink the City of Flint water until it has been tested or unless it is being filtered through a filter meeting the National Sanitation Foundation (NSF)/American National Standards Institute (ANSI) standard 53.
- “Concentration of Lead in First Draw (µg/L)” – With the “Percent of Total Consumed as First Draw” set to 0%, this value will not alter the model run output so the default of 4 micrograms per liter (µg/L or parts per billion [ppb]) was retained.
- “Concentration of Lead in Flushed (µg/L)” – This value applies to household tap water. This was set to 1 µg/L (ppb) as filters meeting NSF/ANSI standard 53 are recommended for use in all households. The filters distributed remove greater than 99% of the lead and would result in filtered water containing lead levels of approximately 1 µg/L (ppb) or less.
- “Percentage of Total Consumed from Fountains” – This was set to 50%, as children in school and daycare settings spend around eight hours or more in those locations. Eight hours could be expected to be approximately half of their waking hours in a day. This value also assumes daily intake of drinking water from a school or daycare source. There could be variation in the amount of time children would actually be drinking water from these locations based on involvement in before- or after-school or daycare programs, activities, or events.
- “Concentration of Lead in Fountain Water (µg/L)” – Modeling runs were carried out for every 1 µg/L (ppb) step between zero and 15 µg/L, and also 30 and 100 µg/L (ppb). Modeling runs for the zero to 15 µg/L (ppb) steps were carried out to perform a sensitivity analysis to evaluate how a one µg/L (ppb) change in lead water concentrations alters the outputs of the model. The 30 and 100 µg/L (ppb) levels were included as preliminary representatives of high-end lead levels obtained from school drinking water fountains.

#### *Site-specific soil data*

Soil lead levels on residential properties vary greatly<sup>8</sup>. The primary influence is from pre-1978 use of lead paint on the outside of buildings<sup>9,10,11</sup>. Lead-paint was banned in 1978. In addition, the age of

---

<sup>7</sup> The Genesee County Public Health Emergency Declaration can be found at [http://www.gchd.us/docs/public\\_health\\_emergency\\_announcement\\_10\\_1\\_15.pdf](http://www.gchd.us/docs/public_health_emergency_announcement_10_1_15.pdf).

<sup>8</sup> Datko-Williams, L., A. Wilkie, et al. (2014). "Analysis of U.S. soil lead (Pb) studies from 1970 to 2012." *Science of The Total Environment* **468-469**: 854-863.

<sup>9</sup> Francek, M. A. (1992). "Soil lead levels in a small town environment: a case study from Mt Pleasant, Michigan." *Environ Pollut* **76**(3): 251-257.

housing<sup>8,9</sup>, paint condition, and distance from the building can greatly impact the concentration of lead in soil. The soil lead concentrations near the foundation of houses with lead paint are frequently over 1,000 ppm<sup>9,11,12,13</sup>. Historic vehicle emissions from leaded gasoline are another source of residential soil lead, so distance from road and traffic volume at the time leaded gasoline was in use are also influential factors on residential soil concentrations<sup>10,11,13</sup>. Other potential influences are fill material (e.g., foundry sand, smelter slag), and/or local industrial emission sources. The highest soil lead concentrations are typically found in urban areas with high population density.

Soil lead data for residential soils in Flint are not currently available. Flint park data and other relevant residential soil lead studies were reviewed to evaluate appropriate surrogate concentrations for this assessment.

The MDEQ<sup>14</sup> reported soil lead concentrations from urban parks including Flint. This data set included 12 sample locations from 10 Flint parks. Surface soil samples were collected at 0-2 inches and subsurface samples were collected at 4-6 inches. This dataset may not adequately represent residential soil samples with a lead paint contribution from buildings. Other studies have shown that open spaces may have much lower soil lead concentrations than areas near residential buildings that were built prior to 1978<sup>11,15</sup>. The geometric mean and geometric mean plus two standard deviation surface soil concentrations (see below) from this Flint park dataset were used for this assessment. The geometric mean plus two standard deviation surface soil concentration represents an upper percentile value that may partially account for the higher soil lead levels expected around buildings with lead paint.

Another data source is from soil samples collected from the Rouge River watershed between 1992 and 2002<sup>16</sup>. This dataset was compiled from MDEQ files and Clayton Group Services files for the Rouge River watershed area in southeast Michigan. Although some data is from Part 201 sites of environmental contamination, most of the samples were collected as a result of other regulatory or real estate due diligence requirements. Sites with known industrial metal sources or that had near surface soil with unknown fill material were excluded from the dataset. The dataset included 28 residential sites that had

<sup>16</sup> Murray, K. S., D. T. Rogers, et al. (2004). "Heavy metals in an urban watershed in southeastern Michigan." J Environ Qual **33**(1): 163-172.

535 surface soil samples with data reported for lead. Sample depth was 0 – 0.5 meters. The geometric mean value for residential surface soils reported from this study (see below) was used for this assessment.

The current Part 201 residential direct contact risk-based soil level was also used for this assessment for comparison. This value was generated from the IEUBK model using an acceptable blood lead concentration of 10 µg/dL, a drinking water concentration of 4 µg/L (ppb) and an Michigan-specific average air concentration of 0.04 µg/m<sup>3</sup> were used in the model at the time of criteria development.

Soil levels examined in the model runs were:

- 47.5 parts per million (ppm) – based on the geometric mean of 0-2 inch soil concentrations in Flint urban parks.
- 155 ppm – based on the geometric mean + two standard deviations of 0-2 inch soil concentrations in Flint urban parks.
- 160 ppm – based on the geometric mean for residential surface soil (0-0.5 meter) from Rouge River water shed<sup>17</sup>.
- 400 ppm - the MDEQ Residential Direct Contact Risk-Based Screening Level for soil.

Both the residential soil geometric mean from the Rouge River watershed and the upper percentile from the Flint park data appear to represent the best surrogates for residential soil concentrations in Flint for this assessment. Although not from Flint, the Rouge River watershed residential soil data appears to be a fairly robust data set for urban residential soils in Michigan. The Flint park data upper percentile (geometric mean plus two standard deviations is approximately equivalent to the 97.5 percentile) may better account for potential building paint contributions to soil concentrations for urban residential soils than the geometric mean concentration of this dataset. The Flint park upper percentile (155 ppm) reported as two significant digits is equivalent to the Rouge River watershed residential soil lead geometric mean (160 ppm). The soil lead concentration of 160 ppm was selected for use in the calculation of the TSG Subcommittee's recommended health-based drinking water lead levels.

#### *Maternal data*

Maternal blood lead levels were changed to 0.8 µg/dL to match the NHANES (2011-2012) geometric mean lead level for women<sup>18</sup>.

#### *Blood level of concern (cutoff) for risk estimation*

A cutoff value of 5 µg/dL was selected as the current Centers for Disease Control and Prevention blood reference level to identify children with blood lead levels that require follow-up actions. It is based on the blood lead level for the 97.5<sup>th</sup> percentile for the U.S. population of children, ages one to five<sup>19</sup>.

---

<sup>17</sup> The value is from Table 5 in Murray, K. S., D. T. Rogers, et al. (2004). "Heavy metals in an urban watershed in southeastern Michigan." *J Environ Qual* **33**(1): 163-172.

<sup>18</sup> The Fourth National Report on Human Exposure to Environmental Chemicals, dated February 2015, can be found at [http://www.cdc.gov/biomonitoring/pdf/FourthReport\\_UpdatedTables\\_Feb2015.pdf](http://www.cdc.gov/biomonitoring/pdf/FourthReport_UpdatedTables_Feb2015.pdf).

Outputs of the modeling runs and recommendation of drinking water lead levels for use during the evaluation of Flint school and daycare drinking water samples

The soil lead level of 160 ppm was selected as being the best surrogate for soil lead levels in the city of Flint. In the event that site-specific soil data is collected, the drinking water lead levels may need to be reevaluated. The entire set of modeling runs and graphs can be found in Attachment 1.

The recommended drinking water lead levels resulted in a 5% risk or lower that a child had a blood lead level above 5 µg/dL. The 5% is an EPA health protection goal for young children exposed to lead at residential properties.

*Evaluating school and daycare drinking water samples together*

The recommended lead screening level for use while evaluating both school and daycare drinking water samples is 2 µg/L (ppb). This lead level in drinking water samples results in no more than a 5% risk that children age 7 or younger would have blood lead levels above 5 µg/dL.

Age range	Blood lead geometric mean (in micrograms per deciliter [µg/dL])	Risk that a child could have a blood lead level above 5 µg/dL
0-1 year olds	2.308	5.004%
0-7 year olds	2.056	2.934%

*Assumptions integral to the use of the health-based school and daycare drinking water lead level*

This calculation includes two assumptions. One is that people have lead levels in home drinking water of no more than 1 µg/L (ppb) or are using filters to reduce lead levels to 1 µg/L (ppb) or below. The second is that children do not live in homes with highly elevated levels of lead in home dust or soil. The modeled lead dust levels do not account for lead coming from pre-1978 paint. Eighty-two percent of city of Flint houses were built before 1970<sup>20</sup>. Soil highly impacted with lead paint may have lead levels higher than the 160 ppm used in this calculation. If children are not drinking filtered water at home, are ingesting lead paint chips, or have elevated levels of lead in home dust or soil, a lead level lower than the one recommended above may need to be selected for the evaluation of school and daycare drinking water samples.

*Evaluating school and daycare drinking water samples separately*

The recommended lead screening level for use while evaluating daycare drinking water samples is

---

<sup>19</sup> The blood reference level and additional information can be found at [http://www.cdc.gov/nceh/lead/ACCLPP/blood\\_lead\\_levels.htm](http://www.cdc.gov/nceh/lead/ACCLPP/blood_lead_levels.htm).

<sup>20</sup> As determined by the U.S. Census and can be found at [http://factfinder.census.gov/faces/tableservices/jsf/pages/productview.xhtml?pid=ACS\\_14\\_1YR\\_S1101&prodType=table](http://factfinder.census.gov/faces/tableservices/jsf/pages/productview.xhtml?pid=ACS_14_1YR_S1101&prodType=table).

2 µg/L (ppb). This lead level in drinking water samples results in no more than a 5% risk that children age 1 or younger would have blood lead levels above 5 µg/dL.

Age range	Blood lead geometric mean (in micrograms per deciliter [µg/dL])	Risk that a child could have a blood lead level above 5 µg/dL
0-1 year olds	2.308	5.004%
0-7 year olds	2.056	2.934%

*Assumptions integral to the use of the health-based daycare drinking water lead level*

This calculation includes two assumptions. One is that people have lead levels in home drinking water of no more than 1 µg/L (ppb) or are using filters to reduce lead levels to 1 µg/L (ppb) or below. The second is that children do not live in homes with highly elevated levels of lead in home dust or soil. The modeled lead dust levels do not account for lead coming from pre-1978 paint. Eighty-two percent of city of Flint houses were built before 1970. Soil highly impacted with lead paint may have lead levels higher than the 160 ppm used in this calculation. If children are not drinking filtered water at home, are ingesting lead paint chips, or have elevated levels of lead in home dust or soil, a lead level lower than the one recommended above may need to be selected for the evaluation of school and daycare drinking water samples.

The recommended lead screening level for use while evaluating K-12 school drinking water samples is 11 µg/L (ppb). This lead level in drinking water samples results in no more than a 5% risk that children age 7 or younger would have blood lead levels above 5 µg/dL. However, when evaluating a population of children age 1 or younger, their risk of having a blood lead level above 5 µg/dL was 8.335%. The 11 µg/L (ppb) screening level is not adequately protective for children under the age of 1.

Age range	Blood lead geometric mean (in micrograms per deciliter [µg/dL])	Risk that a child could have a blood lead level above 5 µg/dL
0-1 year olds	2.61	8.335%
0-7 year olds	2.299	4.917%

*Assumptions integral to the use of the health-based school drinking water lead level*

This calculation includes two assumptions. One is that people have lead levels in home drinking water of no more than 1 µg/L (ppb) or are using filters to reduce lead levels to 1 µg/L (ppb) or below. The second is that children do not live in homes with highly elevated levels of lead in home dust or soil. The modeled lead dust levels do not account for lead coming from pre-1978 paint. Eighty-two percent of city of Flint houses were built before 1970. Soil highly impacted with lead paint may have lead levels higher than the 160 ppm used in this calculation. If children are not drinking filtered water at home, are ingesting lead paint chips, or have elevated levels of lead in home dust or soil, a lead level lower than the one recommended above may need to be selected for the evaluation of school and daycare drinking water samples.

**This Document is a Non-Responsive Attachment.**

**Objective:** Identify the risk of elevated blood lead levels in children exposed to lead in drinking water and in household dust.

**Public Health Assumptions** - The model estimates are only accurate if the following assumptions are met:

1. The concentration of lead in all drinking water sources (e.g., home, school or other location) is equal to the modeled concentration.
2. Lead dust concentrations are consistent with those used here: either 143 ppb for homes 30-60 years of age or 620 ppb for homes older than 60 years.
3. Children are not exposed to lead paint chips.
4. Children are exposed to lead soil concentrations typical of the urban environment in Flint (i.e. soil has not been impacted by lead-based paint).

Children's risk of having an elevated blood lead level will be greater than the model estimates if these assumptions are not met.

**Resulting risk from drinking water with the following lead concentrations:** The goal is that a child should have ***no more than a 5 percent risk*** of having a blood lead level greater than 5 micrograms per deciliter.

Lead Drinking Water Concentration	less than 1 year old		less than 7 years old	
	Lead Dust = 143 ppm	Lead Dust = 620 ppm	Lead Dust = 143 ppm	Lead Dust = 620 ppm
0 ppb	5.8	49	3.7	48
2 ppb	7.2	51	4.6	50
5 ppb	9.7	54	6.2	52
11 ppb	16	59	10	57
15 ppb	20	62	13	59
30 ppb	37	72	27	69
100 ppb	84	92	76	90

The graphs below illustrate the relative contribution to total exposure of lead in drinking water (0 to 100 ppb), compared to soil (160 ppm) plus household dust (143 ppm and 620 ppm). Other exposures, such as ingestion of lead in food and inhalation of lead in ambient air, contribute additional lead uptake to equal 100% of total modeled exposure.

## Executive Summary for a Health-Based Drinking Water Lead Level

October 26, 2015

**Objective:** Identify health-based drinking water lead level(s) to allow re-opening of school and/or daycare water fountains/faucets for student use.

### Public Health Assumptions Included in the Model

The model estimates are only accurate if the following assumptions are met:

1. Children are not exposed to lead paint chips or lead paint dust (at home or elsewhere).
2. Children's drinking water at home is filtered and contains no more than 1 ppb of lead.
3. Children are exposed to lead soil concentrations typical of the urban environment in Flint (i.e. soil has not been impacted by lead-based paint).

Children's risk of having an elevated blood lead level will be greater than the model estimates if these assumptions are not met.

### Resulting risk from drinking water with the following lead concentrations:

The goal is that a child should have ***no more than a 5 percent risk*** of having a blood lead level greater than 5 micrograms per deciliter.

Risk of a child having an elevated blood lead level		
Daycare or School Drinking Water Lead Levels	less than 1 year old	less than 7 years old
0 ppb	4.4 percent	2.5 percent
2 ppb	5.0 percent	2.9 percent
5 ppb	6.0 percent	3.5 percent
11 ppb	8.3 percent	4.9 percent
15 ppb	10 percent	6.0 percent
30 ppb	18 percent	11 percent
100 ppb	55 percent	42 percent

Jori and Eden,  
Please see below. Please note that this is a result below 5. We are happy in this extended circumstance to follow this family. I am off next week and will need you Eden, to advocate with state for the follow up by case managers as it does not fit the specified criteria.  
Merry Christmas!

Toni

Looking forward to hearing from a case manager.

We started our cord blood lead research project about three weeks ago. We've tested about 150 cord bloods. Every mom (except 2) has consented to the research. We are only getting back results now and we have not analyzed anything yet. It would be interesting to confirm if these cord blood results get to the state program.

Hurley delivers about 3000 babies/yr. Most of city of flint babies.

Good morning, Mona,

All lead tests (negative or positive) get into the program, no matter the age or source...but always good to check, as this is a cord blood (Hurley Lab?) and this one needs tracked. Mom and family should be tested as well. By virtue of this email I am looping in the State EPid and our CLPP program as well as the Healthy Homes folks, and our GCHD leads. Thank you, Mona!

Linda, can you coordinate the point person to contact Dr. Mona- Hanna-Attisha regarding name, address, etc on this cord blood for investigation ASAP. Should be coordinated per usual case management between GCHD and MDHHS.

Eden, in our cord blood lead research project, we just got a 4.8 result on a newborn's cord blood. Who can I contact to make sure they get a proper home/water investigation? I doubt these labs get into the lead program.

Eden, in our cord blood lead research project, we just got a 4.8 result on a newborn's cord blood. Who can I contact to make sure they get a proper home/water investigation? I doubt these labs get into the lead program.

Good afternoon, Matt,

Thank you for the information. Currently the data is being pulled from the Data Warehouse every two weeks---I believe that the discussion then was the time it would take then to

clean, de-duplicate and organize the information made the two-week frame workable. I do know that Corinne and her staff are working with Medicaid to address the denominator issue, so let me run this by her. Right off the bat, once the process has become routinized, increased frequency should be possible--

I'm writing to give you a friendly heads up ....

The Flint Water Advisory Task Force will likely, within the next week or two, be sending Gov Snyder a set of recommended metrics for the dashboard that we alluded to in our initial Task Force letter to the Governor earlier this month.

Several of these metrics fall under the purview of MDHHS and tie directly to data (and corresponding data sources) that MDHHS shared on Dec 11 in the "Flint Blood Testing Report". Others relate to metrics that you, Sue, and I discussed in our phone call that same week — i.e., related to connecting CLPPP data (numerator) to Medicaid data (denominator) for the Flint zip codes — or that appeared in the Sit Rep reports that GERALYN shared with the Task Force from Nov 30 and Dec 1.

In other words, I think that MDHHS will already be prepared to present several of these metrics, based on available data. MDEQ and MDE will also be likely state agencies involved in generating data for the dashboard; there may be others as well.

One of the issues that we are currently grappling with is the frequency of updates to the metrics. When are you anticipating that the next Flint Blood Testing Report will be issued?

In the interest of building and sustaining public trust in part with data transparency, there is strong interest on the Task Force in recommending weekly updates (similar to weekly updates on enrollment from the Healthy Michigan Plan). Given the current testing rate in Flint (~200-300 children per week, based on the Dec 11 report) and the hope of elevating that rate, that frequency seems reasonable to me in terms of data robustness. I would be interested to hear your thoughts on this.

Thanks very much,  
Matt

Eden,

Since you reached out to me yesterday, I am going to contact you directly, because I am disturbed about the attached document just provided to me in a FOIA of MDEQ.

Even as I was being given the runaround on my request September 2<sup>nd</sup> to get blood lead data for Flint, DHHS staff were preparing a "campaign" to downplay lead in water as a health concern. The date on the DHHS Flint water communications plan is September 9<sup>th</sup>.

Why wasn't this produced in my FOIA of DHHS? Certainly it was 100% responsive. There are also obviously other documents and e-mails missing as well.

Marc

Michigan Gov. Rick Snyder, legislative leaders name biggest disappointments of 2015

MLive.com – December 29, 2015, By Jonathan Oosting

LANSING, MI — The Flint drinking water crisis was the biggest disappointment of 2015, according to Gov. Rick Snyder and Senate Minority Leader Jim Ananich, who have very different perspectives on the situation.

Snyder says the state acted swiftly once it was alerted to the link between elevated blood-lead levels in children and Flint's switch to a local river for drinking water.

But the state did too little too late, according to Ananich, D-Flint, who continues to criticize the administration and call for legislative hearings on the crisis.

MLive.com, in a series of year-end interviews and media roundtables, asked the governor and legislative leaders to describe their biggest disappointment of 2015.

Read their responses below, [click here](#) to find out what they described as their biggest accomplishments of the year and check back tomorrow to learn about their top priorities for 2016.

Michigan Gov. Rick Snyder: Flint water crisis

The biggest challenge, the thing that you really would have liked to see not be an issue, would have been the Flint water situation. Again, that's not something you'd ever want to see in terms of elevated lead levels, and as we were alerted to those issues, we became proactive and worked hard to address them by offering free water testing, free water filters, free blood testing, follow-up work, helping in the transition back to the Great Lakes Water Authority. This whole issue, we've gone into the schools now to do testing of the water down to the particular fixture. That surprised me that there was no federal or state requirement to do water testing in schools if you didn't happen to be on your own well. We found the issues tend to be isolated, actually, at the fixture. The drinking fountain itself. So the water doesn't have an issue in the system itself, coming in, and even throughout the school until it happens to hit a fixture that has particular problems, so far, in terms of what we've found.

Senate Majority Leader Arlan Meekhof: Courser-Gamrat affair and expulsion

The fact that you all had months and months of coverage on a couple House members that didn't end up very well. That light shines on all of us, and it was unfortunate, those poor choices on their part. (Editor's note: State Reps. Todd Courser and Cindy Garmat were forced out of office in September over allegations they misused taxpayer resources to hide their extra-marital affair. The House voted to expel Gamrat roughly an hour after Courser resigned.)

Senate Minority Leader Jim Ananich: Flint water response

That's an easy one: the governor and his administration's total lack of urgency when it comes to the poisonous water in my community. Even today, they still seem to be missing the boat on the crisis in my community, the credibly that a number of individuals and departments have. This is not a political issue, this is a public health — basically an emergency disaster — issue, and that's how it should be treated. I think if everybody treated it that way, we'd have a lot more work and cooperation, we'd have a lot more action that would be moving in the right direction a lot quicker, and unfortunately that's not be the tact that they've taken.

House Speaker Kevin Cotter: Partisanship

The biggest disappointment, I would say overall, has been partisanship on a number of issues. For me, I think this really started, or at least it reared it's head during another disappointing process or development, which was the expulsion hearings (of Courser and Gamrat). That became very partisan. It was a situation where there was unanimous support on the Republican side to expel two of our members, and unfortunately we went until the wee hours of the morning to get the 2/3 votes we needed because there was political gamesmanship going on that then continued into other areas — third-grade reading — it then continued to the bills we just passed (in December) regarding the data centers. It is something that is very prevalent, and it is disappointing. I certainly understand that we're going to have differences on policy, and that is to be expected, but to the extent that it is holding up things. Take the third-grade reading, for example. Take the expulsion vote. That wasn't about the subject matter of the vote, but rather that was how do we clobber each other. In this case, how do we clobber Republicans and try to take back control of the chamber.

House Minority Leader Tim Greimel: Lack of bipartisan solutions

I think there were some really great bipartisan solutions that we reached in the previous term. We saw Medicaid expansion. We saw the approach to provide assistance to the city of Detroit and allow it to emerge successfully from bankruptcy. Those are the kinds of bipartisan solutions that the people of Michigan expect and deserve, and it's disappointing that under the current House leadership, we have not seen those kinds of bipartisan solutions. I think the House Republicans have become increasingly dominated by the far right-wing conservative elements of their caucus and of the Republican party more broadly. As a result, I think we've seen more partisanship from them, and I think we've seen more ideology and less pragmatism and bipartisanship.

Auditor general findings set off Flint water debate

The Detroit News – December 28, 2015, By Jim Lynch

Findings compiled by Michigan's Office of the Auditor General have set off another debate about who is to blame for Flint's 18-month-long water crisis.

Two state lawmakers are blaming Flint's contaminated water on state environmental officials based on the auditor general's letter. A state spokesman, however, said the findings of state Auditor General Doug Ringler merely confirm what has already been reported.

The document, a set of answers to detailed questions from Senate Minority Leader Jim Ananich, D-Flint, and Rep. Sheldon Neeley, D-Flint, was released late last week. On Monday, Ananich and Sheldon charged state officials with being behind the 2014 decision to have Flint change the source of its drinking water to the Flint River from the Detroit Water and Sewerage Department's Lake Huron.

"This is another example of how the state failed, initially, and continues to fail, by not treating this situation like the emergency it is," Neeley said in a statement. "We need answers, we need action and we need them sooner rather than later."

In the letter, though, Ringler indicates that when Flint and the Detroit water system officials failed to reach an interim agreement on water supply after Flint decided to build its own water authority, "the City of Flint notified DEQ through a permit request of its intent to operate the Flint WTP (Water Treatment Plant) full time using the Flint River."

While under the control of an emergency manager appointed by Gov. Rick Snyder, the city began drawing its drinking water from the Flint River in April 2014. The cost-saving move immediately led to complaints from residents about the taste, color and smell of the water coming from their taps.

In July, August and September, testing results began to paint a darker picture — children in certain areas of the city were beginning to show signs of lead contamination.

The city has since switched back to its previous water supplier, the Detroit water department. A task force is charged with figuring out how Flint's water situation went wrong, including an examination of how corrosion controls were not used in bringing the river water into homes.

Corrosion controls, like phosphates, are added before water leaves the treatment plant to help coat pipelines to prevent lead from leaching in. Following the switch to the Flint River, no such corrosion controls were added. And many of the questions surrounding the problems in Flint center on who decided to omit corrosion controls.

For months, DEQ officials have been under the microscope for their handling of the issue. Some of the harshest criticism has come from those who believe state workers purposely misled the U.S. Environmental Protection Agency over whether corrosion controls were in use.

Critics point to a Feb. 27 email from a state employee to the federal agency contending that a corrosion control program was in place. The Auditor General's report lays out the resulting situation.

■ "It appears the EPA interpreted corrosion control program to mean that corrosion control treatment was in place."

■ "On April 23, 2015, the EPA again inquired as to what the Flint WTP was doing for corrosion control treatment."

■ "DEQ responded on April 24, 2015 that the Flint WTP was not practicing control treatment."

"Based on our review of this and other emails, we have no specific reason to believe that DEQ willingly misrepresented the information to the EPA," the report reads.

On Monday, Ananich contended the Auditor General findings put the blame on state officials.

"What's clear is that corrosion control should have been used, and there are serious failings in our system that must be addressed," Ananich said in a press release. He added that city officials voted in 2013 to switch to the Karegondi Water Authority — a new regional water supply system that is still under construction — but never addressed the issue of using the Flint River.

State environmental and health officials got a measure of support from the office of Snyder, a Republican.

"The letter from the Office of the Auditor General includes some criticisms, but also reflects that state officials were following accepted protocols, or in one case, an interpretation of the corrosion control program that the EPA later clarified," said David Murray, the governor's spokesman.

"But we need to do better in ensuring Flint residents have safe water and tracking children affected by elevated lead levels. We continue to work with the bipartisan task force that is reviewing all the actions at the state, local and federal level and is expected to offer recommendations in a month or so. Gov. Snyder is committed to working with Flint Mayor Weaver and officials on these issues."

On Monday, DEQ Spokesman Brad Wurfel addressed the auditor general's letter.

"The findings of the Auditor General are consistent with our findings at DEQ in our own internal review," Wurfel said. "We appreciate their careful consideration of the issues they were asked to look at."

Bill Berry: Safe drinking water a sure bet no longer

The Cap Times – December 28, 2015, By Bill Berry

STEVENS POINT — There was a time when people in states like Wisconsin and Michigan could be sure that their drinking water was safe. Not anymore.

The stories of bad water in Kewaunee County in northeast Wisconsin and Flint, Michigan, in the Lower Peninsula differ in detail but are eerily similar on some important basics. And those basics point to state administrations that put business interests and government spending cuts above the health and well-being of their most vulnerable citizens.

Flint's troubles began when it was being run by a state-appointed emergency manager. It changed its drinking water source from Detroit's water system to the Flint River to save money. In a massive regulatory failure, state officials never required that the river water be treated to make it less corrosive, causing lead from plumbing and pipes to leach into the water supply.

Soon residents learned of rising levels of lead in the blood of Flint children. Lead poisoning can cause irreversible health and behavioral problems, and children exposed to too much can permanently lose IQ points.

As we learned last week, the state ignored conclusive evidence of lead poisoning and publicly dismissed research findings that linked lead in children's blood to Flint water. Those findings were sent directly to Gov. Rick "Austerity" Snyder's office. Now the state is claiming it made an honest

mistake. Mistake? You bet. Honest? Come on. The city reconnected to the Detroit water system in October, but local officials are still advising residents not to drink the water unless they're using a lead-clearing filter.

There was a time when this kind of malfeasance would be enough to end the political career of the likes of Snyder, but not in today's world.

Meanwhile, people in Kewaunee County are dealing with unsafe wells and a regulatory agency, the Department of Natural Resources, run by political appointees who are more interested in being "open for business" than protecting human health. It got so bad that citizens in Kewaunee County have petitioned the Environmental Protection Agency to step in and enforce clean water laws where the DNR has refused or claimed it doesn't have the authority to do so.

The problem in Kewaunee County is too many cows and too much manure. The county has nearly 100,000 cows, up 64 percent from 59,800 cattle in 1983. Large-scale farms have proliferated. The county is perched atop fragile karst topography, which allows pollutants to make their way to groundwater through cracks and fissures. So while large-farm operators might be doing everything according to current rules, the current rules aren't enough. And in the current framework of failing rules, the land has exceeded its carrying capacity.

Results of a study released this month show that more than one-third of wells in the county were found to be unsafe because they failed to meet health standards for drinking water. The study is significant because unlike previous ones, it was random. While the researchers caution that cow manure can't be blamed for the unsafe wells just yet, would anyone like to venture a bet?

Rather than stepping into the picture on behalf of citizens whose wells are tainted, state officials and Gov. Scott Walker have ignored or danced around the issue. What's clear about this administration is regardless of the environmental issue — metallic mining in northern Wisconsin, frac sand mining in western Wisconsin, cow manure in eastern Wisconsin — this administration will err on the wrong side of the rights of the little people.

But times may be changing. Local people are acting where their state has failed. In April, voters in the Kewaunee County OK'd a groundwater protection ordinance prohibiting manure spreading from Jan. 1 to April 15 on land with 20 feet or less of soil before reaching bedrock.

The trend in the Legislature, meanwhile, has been to reduce local powers. Flint, Michigan, might have some advice on that.

**FOR IMMEDIATE RELEASE**

Tuesday, Dec. 29, 2015

517-335-6397

## **Gov. Rick Snyder takes action on initial findings from Flint Water Task Force**

*Changes to take place at DEQ, meeting planned with Mayor Karen Weaver*

In response to initial findings from the Flint Water Task Force, Gov. Rick Snyder today issued the following statement:

“When I became aware that the city of Flint’s water showed elevated lead levels and that the state’s handling of the situation was being questioned, I requested funding to switch the source back to the Great Lakes Water Authority and appointed an independent task force to identify possible missteps and areas for improvement.

“The task force has done an exceptional job, reviewing stacks of documents and interviewing scores of Flint, Genesee County, state and federal officials. Although the task force’s final report is not yet completed, members have made me aware of some interim findings and corrective steps that I have decided to take immediately in order to restore trust in how the state keeps its citizens safe and informed.

“We’ll continue to work with the community members to make sure we hear and respond to their concerns.

“In addition, MDEQ Director Dan Wyant has offered his resignation, and I’ve determined that it’s appropriate to accept it. I’m also making other personnel changes at MDEQ to address problems cited by the task force.

“But changes in leadership and staff are not enough. I understand there can be disagreements within the scientific community. That is why I have directed both the departments of Environmental Quality and Health and Human Services to invite every external scientist who has worked on this issue to be our partners in helping us improve

Flint water. Let's share research on water and blood lead level testing so we can arrive at accurate and mutually supported conclusions. Together, we should work to affirm that we're using the very best testing protocols to ensure Flint residents have safe drinking water and that we're taking steps to protect their health over the short and long term.

"I want the Flint community to know how very sorry I am that this has happened. And I want all Michigan citizens to know that we will learn from this experience, because Flint is not the only city that has an aging infrastructure.

"I know many Flint citizens are angry and want more than an apology. That's why I'm taking the actions today to ensure a culture of openness and trust. We've already allocated \$10 million to test the water, distribute water filters, and help in other ways. Last week, I called Flint Mayor Karen Weaver, and we're going to meet soon to discuss other ways the state can offer assistance.

"These are only initial steps - we fully expect to take more actions following the recommendations of our task force. When it comes to matters of health and quality of life, we're committed to doing everything we can to protect the well-being of our citizens."

**Subject:** RE: DHHS Document in MDEQ FOIA

Eden,

Thanks. The key is that the e-mails and all other documents that would give insight to its genesis are being withheld.

Obviously, I have the plan because I sent it to you....and I was only aware of its existence because it was in an MDEQ FOIA.

So is it the position of DHHS, that the e-mails and documents associated with the Flint Water Lead Communications Plan, and the meetings associated with that document up to September 9<sup>th</sup>, are not responsive to my FOIA? Or, is it the position of DHHS, that the plan appeared out of nowhere, and there is no documents to indicate who wrote it or where it came from and why?

If it is the former, I have to call you out on that. If it is the latter, I need to know that too, because it is very hard to believe that a document like that just appears out of thin air.

Marc

**Subject:** RE: DHHS Document in MDEQ FOIA

Good afternoon,

I now have a copy of this (this was drafted before I became part of the response, and was never implemented by Toxicology) and there are no concerns in sharing this draft Communications Plan that Toxicology had pulled together--- previous email was just stating why it was not part of P10A package. It is attached, and again, do not hesitate to contact me anytime,

**Subject:** RE: DHHS Document in MDEQ FOIA

Hi Eden,

Today I received what DHHS FOIA claims is the rest of my FOIA documents. But still missing is the document on Flint Water Lead Communication Plan from September 9<sup>th</sup>, 2015, which is clearly responsive to my FOIA because it discusses the work of Virginia Tech. I also e-mailed you and argued that all documents associated with the genesis, writing and conceptualization of the Flint Water Communications plan would be clearly responsive, as are anything associated with the meetings about the document. Bob's e-mail to me mentioned a meeting on the water lead issue on September 8<sup>th</sup>...which I assume was associated with this document.

There is nothing in what was provided to me at all, about the September 9<sup>th</sup> document or the September 8<sup>th</sup> meeting. As far as DHHS is concerned, they are apparently taking the position the document does not exist...and it just came to MDEQ out of thin air. Obviously this is unacceptable to me. Is this the position of DHHS? If not, why do not have either the communications plan, or the documents that help understand where it came from? I do not even know who wrote it.

I also do not believe that Karen's entire body of e-mails has been produced. When I called out the fact that an e-mail from Mona was not in what was provided to me, she simply sent that 1 e-mail to the FOIA officer. I still feel an electronic

search of her e-mails is going to be required if the task force is ever going to understand what DHHS was doing before you were involved.

Thanks in advance for looking into this disturbing problem. The letter today says that all responsive documents were produced, and that my only option is to appeal or sue DHHS.

Michigan Department of Community Health  
Flint Water Lead Communication Plan

---

September 9, 2015

*Presented by:*

*MDHHS-DEH Toxicology & Response Section*

## Plan Overview

---

Project: Flint Water Lead

Name of Campaign: To be Determined (e.g. Lead us to Water: Flint Clean Water)

## Objective

---

The Michigan Department of Health & Human Services has a mission to protect, preserve, and promote the health and safety of the people of Michigan with particular attention to providing for the needs of vulnerable and under-served populations. The residents of Flint currently perceive problems related to the usage of the Flint River as their temporary water source until a pipeline is completed which will bring water from Lake Huron. Problems – both substantiated and unsubstantiated included excess TTHM, discolored water, and high levels of lead in tap water. These problems have given rise to a well-organized community group Water You Fighting For ([wateryoufightingfor.com](http://wateryoufightingfor.com)) and has gotten the attention of water activists/researchers from Virginia Tech University ([flintwaterstudy.org](http://flintwaterstudy.org)).

Given there is no safe level of lead for young children, a public health outreach campaign to inform the public of the sources of lead in their community is recommended. MDHHS will promote collaboration between the City of Flint, the County Health Department, community members, and other interested parties to halt human exposure of lead through development and proactive delivery of scientifically accurate information delivered in multiple formats at a literacy level that is accessible to all.

## Background

---

Drinking water analytical reports find that the water meets the federal drinking water standards and is safe for public consumption. The aesthetic quality of the water, which may make the water unappealing to drink or use, does not make the water unsafe. Poor aesthetic quality, if true, will be a barrier to conducting an effective public health outreach campaign.

Lead is not found to be elevated in the drinking water at the source; however, citizens have reported high lead levels in their tap water. Sources of lead to the tap water are likely from lead piping or solder in or entering the home. Lead piping and solder are sources that the home-owner needs to know how to address. Additionally, older homes (pre-1978) can have lead containing paint and homes near historic high-traffic areas can have elevated lead levels in soil.

## Target Markets

---

- Citizens of Flint who use Flint City Water
- Citizens of Flint who live in homes built in 1987 or before
- Citizens of Flint who are pregnant or have children living in the home that are 6 or

*1st bullet -  
qualify it to  
say residents  
that have lead  
plumbing service  
lines or high lead  
solder.*

## Message Summary

---

- There are personal actions individuals can take to prevent exposure to lead.
- Lead exposure does not just occur through water.
- You can be tested for blood lead levels to determine if you or your children been exposed.
- There are resources available to assist with remediation.

## Call to Action

---

Exposure to lead through pipes, paint, and soil are preventable. There are steps people can take to be proactive in preventing their exposure and potential health issues. MDHHS notes that this problem is also not limited to Flint. This campaign will be created and piloted with the City of Flint, but may be expanded statewide.

## Project Plan

---

### Public Meetings –

- Begin with small groups to identify key stakeholders
- Plan larger meeting addressing
  - the lifespan of water from source to treatment center to home
  - how people can identify if their home may be affected
  - what the VTU results really mean
  - what can be done on an individual, city, and state level

### e-Toolkits, Social Media & Print Outreach

- Compile existing information on being lead-safe
- Create easily shared infographics – what can be done, what are signs and symptoms
- Create brochures about health effects of lead

## Project Timeline

---

Responsibilities	Target Date	Objective	Tasked to:
TBD	TBD	TBD	TBD

## Current Media Review

- On Monday, Aug. 31, the researchers reported 42 percent of 120 initial samples from Flint had lead levels that were more than 5 parts per billion, "which suggests a serious lead-in-water problem, according to our experience and criteria."
- The EPA requires water systems like Flint's to collect tap samples from sites that are more likely to have plumbing materials containing lead.
- If more than 10 percent of samples exceed 15 ppb, then water systems are required to take action, including steps to optimize corrosion control treatment.
- "The city of Flint has offered free and independent testing to residents since spring, and I encourage people to use this service if they have questions," Walling's statement said.
- Edwards, a professor of civil and environmental engineering, said the elevated lead levels he has seen in Flint tap water are tied to a corrosive water source that contains about eight times more chloride than Detroit water does.
- "Chloride is generally considered to be very corrosive to iron. For instance, chloride present in road salts applied in the winter causes iron in cars and bridges to rust," the Virginia Tech team's website says.
- "This could be a huge public health problem. ... The Flint water just ate the pipe up," Edwards said of the testing he has overseen so far.
- "If it were me, I would not be using (Flint River water) for cooking or drinking unless I had it tested for lead," said Edwards, who previously mounted a six-year campaign that succeeded in forcing the U.S. Centers for Disease Control and Prevention to admit it had misled the public about the risk of lead in the Washington, D.C., area's drinking water, according to The

Washington Post.

- Since the switch, the city has been plagued by issues such as water main breaks and boil water advisories because of bacteria and has been in violation of the Safe Drinking Water Act because of high levels of total trihalomethanes (TTHM), a byproduct of chlorinating river water.
- The Rev. Allen Overton, who hand-delivered petitions to Walling on Monday, asking that city officials reconnect the Flint water system to Detroit, said Wednesday that the Virginia Tech experiment is more evidence Flint is not using the best quality of water available.
- "We have a major health issue here, (and) they are not being honest with the citizens of Flint," Overton said.

#### Flint Water Petition:

[https://secure3.convio.net/fww/site/Advocacy;jsessionid=7266B35978FAD2EFBD3A57D87D5085AB.app334b?pagename=homepage&page=UserAction&id=2199&autologin=true&s\\_src=blg&s\\_subsrc=070915](https://secure3.convio.net/fww/site/Advocacy;jsessionid=7266B35978FAD2EFBD3A57D87D5085AB.app334b?pagename=homepage&page=UserAction&id=2199&autologin=true&s_src=blg&s_subsrc=070915)  
a.

Dear [Flint Mayor Dayne Walling and Flint City Council],

Water is a basic human right. The United Nations General Assembly recognizes that access to safe drinking water and sanitation are essential to the realization of all human rights.

In 2014, Flint's emergency manager disconnected the city from the Detroit Water and Sewerage Department (DWSD) and started providing residents with water from the Flint River. Since that time, residents have been struggling to maintain access to a clean, safe drinking water supply.

Residents of Flint report having tap water with high levels of copper, lead, THMs (chemicals that result when chlorine mixes with organic matter), tin, lime and iron. The water is often brown or bluish-green in color and contains sediment. As a result, people are experiencing symptoms including hair loss, lead poisoning and diseases related to consuming high levels of copper (to name a few).

The Flint River clearly is not a safe, reliable source for the city's drinking water. It was as easy as pushing a button to disconnect from DWSD; it's time to push the button again, reconnecting Flint to DWSD and providing Flint residents with the clean, safe water they deserve.

Please reconnect Flint to the Detroit Water and Sewerage Department immediately and make water safe and clean for all.

Sincerely,

[Your Name]

[Your Address]

[City, State ZIP]

Washington DC

<https://www.dwater.com/lead/>

- Sources of lead in drinking water

- **Lead service pipe**

In the U.S., lead service pipes were installed until the mid-1950s. Older properties may still have lead service pipes, which connect the water main in the street to household plumbing. The service pipe is owned by the property owner. Under certain conditions, DC Water is authorized to repair, maintain or renew the portion of the service pipe in public space. The maintenance of the portion of the service pipe on private property is the exclusive responsibility of the property owner. A "partial" lead service pipe replacement is where a portion of the service pipe is replaced, but a portion made of lead remains in public or private space.

Lead service pipes were installed until the mid-1950s.

- **Lead solder**

This connects pipes in household plumbing. In 1987, lead solder was banned from use in household plumbing. If your house was built before 1987, your plumbing may have lead solder.

- **Brass faucets, valves or fittings**

Almost all faucets, valves and fittings have brass components. Until 2014, brass faucets and fittings sold in the U.S. and labeled "lead-free" could contain up to eight percent lead. Effective January 2014, the Reduction of Lead in Drinking Water Act specifies that these materials may not contain more than 0.25 percent lead.

- **Galvanized iron pipes**

Household galvanized pipes are old, corroded pipes that were installed in many homes before the 1960s. These pipes can release lead in water if the property has, or previously had, a lead service pipe. Galvanized pipes are made with a protective layer of zinc. However, the zinc layer erodes over time and results in corrosion. When lead is released from a lead service pipe and passes through galvanized plumbing (particularly over decades of use), lead can accumulate on the inside, corroded walls of this plumbing.

Lead release from galvanized pipes can vary from home to home and can continue to occur even after a lead service pipe is replaced. Galvanized pipes can cause other water quality problems, such as low water pressure and discolored water. For additional information on household plumbing, click here.

*? typically  
odor + taste problems too!*

**Subject:** Fwd: Flint Water

Sue and Dr. Wells - see below and attached. We wanted to share what UnitedHealth is doing in Flint. Thought you may find this a helpful example of what our health plan partners are implementing after our discussions. We will be following up with the other plans shortly and will pass along what we get from them too. If there is anything in here that is concerning, please let us know.

The L letter to all providers in Flint, which was sent to you both for sign off, will be going today. I also understand that we have a plan on metrics/data reporting too.

Please let us know if there is anything else Medicaid can do to be helpful.

Happy New Year!

Chris

**Subject:** Flint Water Concerns

Chris,

In recognition of the need for an all-hands-on-deck response to the Flint Water concerns, I want to share with you the UnitedHealthcare Community Plan outline (attached) for how we will address the identification, outreach, education, and care coordination for our members in the Flint area. Critical to such efforts is coordinating care with primary care providers (PCPs) where possible, working with other agencies, and keeping our message consistent with the public health leaders at MDHHS and Genesee County Health Department.

We will convey the public health messages regarding water testing, free water filters, and dietary choices that reduce lead absorption. It is also important to communicate with the Genesee County Health Department for those children at higher risk to arrange nurse home visits to evaluate and specifically educate families. We will follow-up and coordinate with PCPs to follow blood levels and respond accordingly.

We will leverage our current relationships with the local health department, primary care providers, and our CSHCS care managers to make sure that we complete an effective outreach, education, and care coordination. Though our current membership in the Flint area is small, we expect that with the new contract, it will grow and we are prepared to continue to assist this growing customer base as they come on board.

All of this is consistent with our broader efforts for the health of our member population.

Thanks,

Brian

## **UnitedHealthcare Community Plan Enhanced Blood Lead Level Screening and Education**

### **Identify and verify those at risk**

- UHCCP Eligible Members in Flint zip codes, 48501-48507
- Focus on households with Children 6 years old and younger
- MCIR search to see if blood level since April 2014
- Continue to monitor our list to account for additional at-risk members

### **Outreach**

- Letters to all eligible members
- Direct phone outreach to households with children 6 and under
- LHD or CHW to homes of those we cannot reach by phone
- CMO to contact PCPs to ensure follow-up

### **Consistent Message**

- Source materials from MDHHS, and GCHD
- Education to all members
  - Water testing
  - Diet to reduce blood lead absorption
  - Potable water
    - Free filters
    - Bottled water
- Focused education to households with children 6 and under
  - Blood lead testing
  - Need for consistent follow up with PCP
  - PCP appointment scheduling as needed
  - Transportation assistance as needed

### **Follow-up/Care Coordination**

- Follow blood levels through MCIR for identified children
- Care Coordination with PCP to ensure consistent follow up
- Genesee County Health Department care coordination of Nurse Home Visits for those at higher risk

**This Document is a Non-Responsive Attachment.**

If I remember correctly – there was some concern that she is under IRB for her study at Hurley. And that that data is not subject on our reportable to public health under the code. The S – actually – she does not need additional IRB – she just needs parental consent to share the information with public health. I will clarify that with her.

**Subject:** Re: Newborn

Given that this is a research study, the Hurley lab may not be handling the results in the same way as they handle other lead tests. Can the lab be contacted and asked about that, by someone on Dr. Hanna-Attisha's team? If the results are handled under a research protocol, would the results be required to be reported under the Public Health Code, or would they be considered confidential under the terms of the consent form signed by the research participants? In other words, what does the research protocol and the consent form say? I assume/hope the family would welcome a home intervention, but need to be sure the research protocol re confidentiality isn't being violated. If it appears that way, then someone on the research team should get consent from the family for public health followup, I would think.

Excellent work Jim ( I also note the 12:46 am time on your e-mail).

I would not expect significant exposure for adults from hand to mouth behavior or skin adsorption during hand washing. Please be sure they sample any kitchen taps that are used for food preparation. There could be some concern for effectiveness of the tap filters if lead concentrations are outside the range tested by NSF when certifying the filters.

Linda

**Subject:** Re: Whaley Childrens Center 1201 N. Grand Traverse

I met with Michelle Johnson, Director of Operations.

- On 10/16 United Way delivered filters to Whaley.
- Whaley recently replaced filter cartridges, because red indicator light.
- Children drink only bottled water from many donated sources.
- Whaley maintenance crew sampled water, but mistakenly only filled the liter bottles 1/2 way to top.
- The 2.516ppm is the employee restroom @ admin building. It's a newer hand sink fixture, but old plumbing. I couldn't remove aerator to check for lead particulate, because of the fixture design. No valve, so posted "Do Not Use." At the extreme level, I want to check with MDHHS toxicology regarding potential risks from lead residual from hands to mouth (not skin absorption)
- .213 is off site at Rotary and no children are there. It will be posted or made inaccessible until demonstrated to be safe.
- .029 is a classroom and concerning. Michelle will check in morning to see if it is drinking water and follow up with me.
- Tomorrow appropriate resampling is scheduled by Whaley staff. I recommended sampling drinking fountains also and make them inaccessible until demonstrated safe.
- Michelle estimated 27 children at Whaley,
  - A. None age 0-5,
  - B. One age 6,
  - C. One age 8
  - D. Twenty-five age 11-16.
- Michelle indicated most children have same Hurley doctor, but not sure who physician's name.
- She referred me to Michelle Shamel, Whaley's Director of Clinical for information regarding blood testing and physician. I'll follow up with her in morning.

Jim

Thanks, I'm stopping by Whaley tonight to make sure that no one is drinking the water and the concerns below are addressed.

I received the attached water results this afternoon and I will bring a copy to help me identify the fixture locations at Whaley. I intend to have the manager shut off the valve at 2.516ppm, p.39 of the attachment. Results on p. 19, 29, 32, 39, 48 are all elevated at Whaley and others are concerning.

It is not common for us to receive the MDEQ daily report with this many lead results or the number of elevated in one location. We commonly receive between 1-15 general water results, which most are usually bacteria, partial chemistry and arsenic, mixed in with a few lead and copper.

I'll report back what I find at Whaley.

Jim,

I just got a call from Eden Wells and DEQ just told her Whaley CC was given sample results of 213ppm and 2516ppm from two fixtures. As this is a center for foster kids it would be a good idea if we verify they are not using those fixtures. Find out if they have filters or are using bottled water. Are the kids there seen by a physician and tested for lead? Have they notified their physician(s) of the problem?  
Thanks

[View it in your browser.](#)

Enhanced Blood Lead Level Screening Provider Message  
December 10, 2015

Michigan Medicaid Early Periodic Screening, Diagnosis and Treatment (EPSDT) guidelines require children to be tested for blood lead poisoning at 12 months and 24 months, and between the ages of 36-72 months if not previously tested (<http://www.mdch.state.mi.us/dch-medicaid/manuals/MedicaidProviderManual.pdf>). Due to the enhanced public health issue of an increased risk for lead exposure in the City of Flint, providers have been advised to follow enhanced guidelines for lead testing in children:

- ? Providers should screen ALL children (regardless of Medicaid/insurance status) aged 0-6 years of age exposed to Flint city drinking water after April 2014. Note: this includes all children younger than 1 year and children between the ages of 3-6 years.
- ? If the child has already been screened within the time period of April 2014-present by a capillary test, healthcare providers should follow-up on any elevated levels >5mcg/dl to ensure confirmatory venous testing is conducted.
- ? Utilize the standard Blood Lead Level (BLL) Quick Reference for Primary Care Providers at [http://www.mi.gov/documents/deq/ProviderQuickReference\\_Sept2015\\_501631\\_7.pdf?20151204122739](http://www.mi.gov/documents/deq/ProviderQuickReference_Sept2015_501631_7.pdf?20151204122739)
- ? All clients with blood lead levels greater than 5mcg/dl should be referred for case management coordinated through Genesee County Health Department. Providers can make referrals for case management at 810-257-3833
- ? Providers should inquire about use of a drinking water filter and/or bottled water in all clients residing in city limits. Clients and providers can call 2-1-1 for locations for filter distribution.
- ? All people with Flint water should be advised to eat regular meals with a diet high in calcium, iron and Vitamin C to decrease lead absorption, mitigate the effects of lead exposure and to enhance the excretion of lead.
- ? Healthcare providers should inquire about other potential sources of lead in the household per current recommendations (see: [https://www.michigan.gov/documents/mdch/testing-screening071009\\_287511\\_7.pdf](https://www.michigan.gov/documents/mdch/testing-screening071009_287511_7.pdf) )
- ? Additional information and updates on Flint water are available at: [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater) and [www.gchd.us](http://www.gchd.us)

When we did the lead-focused cooking class at the farmer's market, we had filters on hand as well. We stored them in the clinic to take down the next day for the class, but then it dawned on me, why the heck didn't we always have filters in the clinic. So now we have filters in the clinic to give to families.

There are 4 practices that see most exposed kids (Hurley, Mott, Hamilton, Akpinar) - rather than webinars or things that people have to go to (extra work and just seen as noise), I would suggest people go to those practices - arrange with office managers, buy the practice lunch, give them a very short presentation, leave them handouts, our nutrition books, share what they are supposed to do, and bring boxes of filters. If you could even bring provider-specific data with you, that would be great - people are motivated by personal performance metrics. Then you will see behavior change. I would be more than happy to help.

Good morning ,

I will relay, with your permission of course, this email to our Medical Services Administration, with whom I have had the same discussions. Rest assured that I saw a multi-point plan from this health plan about how to address the issues in their patient population, and these community engagement pieces are just one part.

One issue all are trying to capture is the urgency under which the enhanced testing needs to be conducted, so this is one of a number of strategies the health plans are utilizing.

Another part is of utmost concern, that I know is also in multiple health plans' strategic approaches, is that of provider engagement. Despite the news and the blast faxes and the Health Alerts and the Provider Letters and the Toolkits, we continue to hear from citizens, the Governor's Task Force and EBL case investigators and case managers, that providers

are not asking about lead exposure to Flint water since April 2014, nor asking about testing/screening, or whether families have filters. I tried to set up a provider forum in Nov-Dec to little or no interest, but am now working to get one rolling regardless, in partnership with health plans, by end of this month.

It would really be helpful if you could be there to speak about this very issue and give the perspective of a local physician responding to the crisis, and a leader of best practices. We will webinar it and archive it as well ( I am wondering if I can make it CME-able as well), and Dr. Reynolds, it would be great to have you involved as well----

Thanks for your reply, Eden. Yes, I have had discussions with Matt Davis about this as well and it was my understanding that it was recommended to expand screening, but still to push kids to their medical homes as you said. If we all agree to drive kids to their medical homes first, the primacy of the medical home, why is that not being done first?

What are the medicaid HMOs doing to push kids to their medical homes? How are they incentivizing visits, providing case management, partnering with practices, enhanced transportation, etc? This is what needs to happen - not only will all of this improve lead screening rates, but also immun rates and all other HEDIS measure that HMOs (and providers) care about.

Hi Mona,

The Governor's Task Force has made a number of preliminary recommendations to MDHHS last month, and a major one is to maximize blood lead screening. The primary care home is best, all agree, and health plans are identifying any children that have not been tested. Current thoughts are that there could be thousands. Health plans will be closely monitoring the provider follow up as well post initial screens. And, while it does not pick up potential lead exposure prior to Oct 1, water is still a potential source if public health measures are not being used, or used appropriately. Also there is a need to establish the prevalence of EBL in this impacted community-

I have had long discussions with Matt Davis about this, and Larry is aware as well. I can discuss further if needed. But all, including Medicaid, agree with the primacy of the patient primary care home.

This is an informational update and the Genesee County Health Department will provide these updates on a daily basis after 4 pm. We are asking all partners included in this email to provide any pertinent updates **DAILY** to Hilda McShane by 2:00pm. If you have nothing new to share, please inform Hilda that you have no updates at this time.

- In an upcoming broadcast, abc 12 will reinforce the need for water filters, availability of replacement filters and distribution locations:
  - MDHHS, 125 E. Union Street, Flint, 48501
  - MDHHS, 4809 Clio Road, Flint, 48504
  - GCCARD, 601 N. Saginaw Street, Suite A, Flint 48502
  - GCCARD, 2727 Lippincott Blvd, Flint, 48507
  - Flint City Hall, 1101 South Saginaw Street, 48502
- In partnership with Flint Community Schools and Molina Health Care, Genesee County Health Department will work with these organizations to host a lead screening event on January 12, 3:00 pm at Freeman Elementary school. Freeman Elementary school is located at 4001 Omega Avenue, Flint, MI 48507.
- As of January 4, 2016 **23,879** water filters have been distributed to residents in the City of Flint, Burton and Flint Township.

### Michigan Department of Health and Human Services Water Filter Distribution As of December 31, 2015

---

	Distributed	Remaining
Water Filters	458	<b>3,585</b>
Water Pitchers	51	<b>485</b>
Replacement Cartridges - Brita	544	<b>7,525</b>
Replacement Cartridges - PUR	74	<b>5,632</b>

**Michigan Department of Health and Human Services**  
**Water Filter Distribution**  
**Summary total from October- December 31, 2015**

	Distributed	Remaining
Water Filters	11,415	<b>3,585</b>
Water Pitchers	235	<b>485</b>
Replacement Cartridges - Brita	1,475	<b>7,525</b>
Replacement Cartridges – PUR*	74	<b>5,632</b>
Replacement Cartridges - Zero	5	<b>370</b>

\*Please note that MDHHS did not buy the current PUR filters being distributed. Once these are exhausted if needed DHHS will purchase PUR replacements.

**FOR IMMEDIATE RELEASE**  
**GENESEE COUNTY COMMISSIONERS DECLARE**  
**EMERGENCY**

Flint, MI -- January 4, 2016 – During their first board meeting of the year, Monday morning, Genesee County Commissioners declared a state of emergency in Genesee County. The move a sign that county leaders support Flint Mayor Dr. Karen Weaver and her efforts to get resources and relief to the residents suffering from the ongoing water situation in the city.

Mayor Weaver declared a state of emergency in Flint last month to raise awareness about the severity of the problems surrounding the water situation that continues to effect residents. The problems a result of the man-made disaster caused by the city switching to the Flint River as a water source in 2014.

Following the board’s vote today, Genesee County Commission Chairperson, Jaime Curtis said, “This is a state, man-made disaster and we’re going to ask the state to fix their disaster. Curtis also said, "Genesee County is the fifth largest county in Michigan and we will not be ignored.”

Mayor Weaver hopes the county’s show of support will convince the Governor to provide the City of Flint with financial support to help leaders address immediate infrastructure needs. Those needs include more than \$45 million to replace every identified lead pipe in the city, reimbursement of the \$2 million spent to switch back to the Detroit Water Sewerage Department, \$6 million to help with the transfer to the Karegnondi pipeline and additional resources to support the city’s Heath Initiative to assist affected adults and children in Flint who have consumed water contaminated with lead.

In an interview with media after the board’s emergency declaration Mayor Weaver said, “It’s a victory and a step in the right

direction.” The mayor plans to meet with Governor Snyder in Lansing Thursday of this week to discuss the state’s response and next steps.

If you have nothing new to share, please inform Hilda that you have no updates at this time.

- Today, Michigan Department of Health and Human Services (MDHHS) received approval from Department of Environmental Quality (DEQ) to allow the use and public display of the Bath Time Poster that was developed to address individuals' concerns about using the water to bathe their children (see attached). The Genesee County Health Department encourages all agencies to display the bath time poster.
- Hurley Children's Hospital with MSU extension will offer their first lead focused cooking class at the Farmers' Market this Saturday. Lead focused nutrition recipes and resource book will be distributed at the cooking class. Press release promoting the cooking class will go out tomorrow.
- Mott Children's Health Center continues to work with City of Flint to pick up PUR filters.

**From** Jamie Gaskin

Over the past 48 hours some additional support has started to surface given the National and regional media coverage. These are all

developing streams of possible support and generally reflect organizations and business that got connected several months ago during our initial response. These are developing but I wanted to loop in all of you as this develops and also share some basic information:

1. MSP has again surfaced another source of bulk water that is Federal surplus. This water is free as long as we pay for shipping. I have looped in Bill Kerr at the foodbank as his team is really managing the logistics and understands the local demand and the ability of the local distribution system to handle storage etc.. These shipments come at the cost of shipping. This is about ½ the cost of buying the water and shipping ranges from between \$1000-\$2,000 per semi.
2. PUR – They have reached out to me again (Previously donated 2,000 faucet mount systems). I have directed them to consider donation of additional replacement filters and a financial donation. The financial donation would support shipping costs of more bottled water as well as possible prevention work.
3. ZeroWater – I am again working through some ideas with their CEO. He is very interested in the schools. I am not sure how this will develop.

\*As we have shared in the past the distribution system currently has supplies of filter mount systems (PUR & Britta), replacement filters (PUR & Britta), and 8 cup pitchers (ZeroWater). If we get to levels below 500 available units for any system it is my understanding that this will serve as a trigger for us to resource more.

I also want to share that I have about \$15,000 left of the more than \$275k donated. As I get closer to expending all the funds the UW will continue to evaluate our own internal investment and make some adjustments. Please direct any possible financial investors to support the water fund either by calling me directly or making even small donations on our website. I will also be working with Isaiah Oliver at the Community Foundation around the MI Health Endowment Funds. Both the United Way and the Community Foundation are committed to working together and trying to maintain maximum flexibility as the situation develops.

I will follow-up though the normal Health Department updates moving forward but I just felt it necessary to try to bring everyone up to speed on developing work. If you have any questions for me please let me know. I will be available all through the Holiday period via cell phone and I will only be out of town from Christmas eve through the following Saturday. Please do not hesitate to call me for any reason.

This is an informational update and the Genesee County Health Department will provide these updates on a daily basis after 4 pm. We are asking all partners included in this email to provide any pertinent updates **DAILY** to Hilda McShane by 2:00pm. If you have nothing new to share, please inform Hilda that you have no updates at this time.

- City of Flint picked up Two Hundred (200) ZeroWater 8-Cup Filter Pitchers from Flint Community Schools 12/14/15 for distribution.
- The Genesee County Health Department has a total of 1,650 Pur water filters for distribution.
- Mott Children's Center will give City of Flint 117 water filters from the first batch of filters distributed at U of M Flint.
- Department of Health and Human Services and GCCARD attended the Health Fair on Saturday, December 12 and distributed the following at Bethel United Methodist Church's health fair.
  - 12 Filters
  - 17 Replacement Cartridges
  - 2 PUR replacements
  - 1 Pitcher
- Between December 11 and December 14, 2015, Genesee County Community Action Resource Department and Department Health Human Services distributed the following:
  - 78 filters
  - 6 pitchers
  - 53 replacement filters
- Sheryl Thompson from Michigan Department Health Human Services will order replacement filters when the inventory level reaches 500. After replacement cartridge order is placed, it takes a few days for delivery.
  - The Zero Water Pitcher replacement filters have been delivered. All sites will begin giving out a pitcher

replacement filter with every Zero Water pitcher given out.

### Summary October through December 14, 2015

	Received	Distributed	Remaining
Water Filters	15,000	11,232	<b>3,768</b>
Water Pitchers	720	229	<b>491</b>
Replacement Cartridges	9,000	1,258	<b>7,742</b>

**Subject:** RE: Genesee County Health Department EOC 12/7/15

- Mott Children's Health Center distributed 117 PUR filters (that you attach to the faucet, [part of the batch that the United Way purchased and was distributed at U of M Flint).
- Mott Children's Health Center's leadership has put together a lead information packet. The intent of the packet is to distribute to patients. The packet includes information on appropriate filters and resources and how to obtain them. Genesee County Health Department will update Mott Children's Health Center as necessary with new distribution locations.

- As noted by Mott Children's Health Center, most parents of newborns continue to use bottled water to mix with formula.
- Genesee County Health Department continues to distributed water filters at its lead screening clinic in Burton.
- After a complete inventory is taken at all water filter distribution sites of remaining water filter cartridges, The State of Michigan has agreed to purchase additional PUR replacement filters.
- As of December 4, Michigan Department of Health and Human Services has distributed the following:

Water Filters	11,046
Water Pitchers	184
Replacement Cartridges	1,073

- Michigan Department of Health and Human Services and Genesee County Community Action Resource Department have distributed the following in November: water filters 778, Zero Water Pitchers 63, and replacement filters 924. Total filter distribution as of October 1 is 10,951.
- The MDEQ and the City are coordinating the distribution and analysis of containers (bottles) for water testing. Bottles are available at City Hall and the water plant. Genesee County Health Department does not have bottles for distribution. Customers' name, phone, and address are required to be documented on a form when the water sample is submitted for analysis, not when the bottle is picked up. Analysis is conducted in Lansing at the MDEQ lab.

- Genesee County Health Department (GCHD) will distribute an additional 100 water filters to the City of Flint for distribution at City of Hall.
- Besides all the water filter distribution occurring at the blood lead screening clinics and offsite exhibits by Genesee County Health Department's staff, the Health Department continues to distribute water filters at its Burton WIC clinic and continues to educate parents on lead in water issues. Distribution at the WIC clinic has been swift and additional inventory, another 100 water filters, will be added to the WIC distribution inventory.
- Genesee County Health Department will distribute a press release that supports Professor Marc Edwards, of Virginia Tech University's announcement that Flint residents do indeed need to continue to use water filters.
- After a through inventory of water filters, Michigan Department of Health and Human Services (MDHHS) will purchase more Pur replacement filters. As suggested by MDHHS staff, GCHD will inventory its supply of replacement filters and give inventory outcome to MDHHS.
- Genesee County Health Department will host blood lead screening clinics at Grace Emmanuel and Bethel United Methodist churches.

**Subject:** Re: Genesee County Health Department EOC 11/17/15

Genesee County Health Department is working with the CDC to develop phosphate educational materials.

United Way (UW) CEO, Jamie Gaskin and Genesee County Health Department Health Officer, Mark Valacak have been discussing the strategic use of Americore volunteers during this water crisis. Suggested volunteer work includes: distribution of filters, lead education, and assist at health fairs and at church exhibits. Volunteers may be available in February of 2016.

UW Jamie Gaskin reported that UW will giveaway 110 Thanksgiving baskets. The baskets will contain a water filter system.

For those who need 8oz - Zero cup water filters, please contact Tony Sitko at Flint Community Schools. His email address is: [tsitko@flintschools.org](mailto:tsitko@flintschools.org).

Genesee County Health Department will give City of Flint 50 PUR water filters for distribution at City Hall.

Water filter distribution is well over 13,596.

BJ Roach from the State Police had nothing to report at this time.

We are asking all partners included in this email to provide any pertinent updates **DAILY** to Hilda McShane by 2:00pm. If you have nothing new to share, please inform Hilda that you have no updates at this time.

- Genesee County Health Department will send staff to Flint Community Schools' city wide parent meeting at Brownell STEM Academy. Genesee County Health Department representatives will present lead education. The presentation will take place on Wednesday, November 18 at 9:30 am.
- Brownell STEM Academy lead screening was hosted by Flint Community Schools with assistance from McLaren Health Plan and Genesee County Health Department. Twenty seven kids were tested. Test results will be mailed to parents in two weeks.
- During the 3:00 to 6:00 pm clinic, a combination of Pur and Brita water filters and replacement filters were distributed. A total of 60 filters and replacement filters were distributed.
- Genesee County Health Department, Genesee Health Plan, Crim Fitness Foundation, University of Michigan Flint Nursing Program, The MDHHS environmental consultants' ETC, and 211 exhibited at Brownell's lead screening clinic where they educated participants on lead preventative and nutrition.
- Home Depot was at Brownell's clinic answering water filter installation questions.

If it would be of any help, we could have a lead case manager attend as well to put a name and contact information in physicians hands. This morning I asked the case managers to contact the largest pediatric practices and see about meeting with them regarding case management services, sources for filters, nutrition and answer any general questions they might have.

Good morning ,

I will relay, with your permission of course, this email to our Medical Services Administration, with whom I have had the same discussions. Rest assured that I saw a multi-point plan from this health plan about how to address the issues in their patient population, and these community engagement pieces are just one part.

One issue all are trying to capture is the urgency under which the enhanced testing needs to be conducted, so this is one of a number of strategies the health plans are utilizing.

Another part is of utmost concern, that I know is also in multiple health plans' strategic approaches, is that of provider engagement. Despite the news and the blast faxes and the Health Alerts and the Provider Letters and the Toolkits, we continue to hear from citizens, the Governor's Task Force and EBL case investigators and case managers, that providers are not asking about lead exposure to Flint water since April 2014, nor asking about testing/screening, or whether families have filters. I tried to set up a provider forum in Nov-Dec to little or no interest, but am now working to get one rolling regardless, in partnership with health plans, by end of this month.

It would really be helpful if you could be there to speak about this very issue and give the perspective of a local physician responding to the crisis, and a leader of best practices. We will webinar it and archive it as well ( I am wondering if I can make it CME-able as well), and Dr. Reynolds, it would be great to have you involved as well---

Thanks for your reply, Eden. Yes, I have had discussions with Matt Davis about this as well and it was my understanding that it was recommended to expand screening, but still to push kids to their medical homes as you said. If we all agree to drive kids to their medical homes first, the primacy of the medical home, why is that not being done first?

What are the Medicaid HMOs doing to push kids to their medical homes? How are they incentivizing visits, providing case management, partnering with practices, enhanced transportation, etc? This is what needs to happen - not only will all of this improve lead screening rates, but also immun rates and all other HEDIS measure that HMOs (and providers) care about.

Hi Mona,

The Governor's Task Force has made a number of preliminary recommendations to MDHHS last month, and a major one is to maximize blood lead screening. The primary care home is best, all agree, and health plans are identifying any children that have not been tested. Current thoughts are that there could be thousands. Health plans will be closely monitoring the provider follow up as well post initial screens. And, while it does not pick up potential lead exposure prior to Oct 1, water is still a potential source if public health measures are not being used, or used appropriately. Also there is a need to establish the prevalence of EBL in this impacted community-

I have had long discussions with Matt Davis about this, and Larry is aware as well. I can discuss further if needed. But all, including Medicaid, agree with the primacy of the patient primary care home.

---

	Distributed	Remaining
Water Filters	458	<b>3,585</b>
Water Pitchers	51	<b>485</b>
Replacement Cartridges - Brita	544	<b>7,525</b>
Replacement Cartridges - PUR	74	<b>5,632</b>
Replacement Cartridges - Zero	5	<b>370</b>

### **Michigan Department of Health and Human Services Water Filter Distribution Summary total from October- December 31, 2015**

---

	Distributed	Remaining
Water Filters	11,415	<b>3,585</b>
Water Pitchers	235	<b>485</b>
Replacement Cartridges - Brita	1,475	<b>7,525</b>
Replacement Cartridges – PUR*	74	<b>5,632</b>
Replacement Cartridges - Zero	5	<b>370</b>

\*Please note that MDHHS did not buy the current PUR filters being distributed. Once these are exhausted if needed DHHS will purchase PUR replacements.

**FOR IMMEDIATE RELEASE  
GENESEE COUNTY COMMISSIONERS DECLARE  
EMERGENCY**

Flint, MI -- January 4, 2016 – During their first board meeting of the year, Monday morning, Genesee County Commissioners declared a state of emergency in Genesee County. The move a sign that county leaders support Flint Mayor Dr. Karen Weaver and her efforts to get resources and relief to the residents suffering from the ongoing water situation in the city.

Mayor Weaver declared a state of emergency in Flint last month to raise awareness about the severity of the problems surrounding the water situation that continues to effect residents. The problems a result of the man-made disaster caused by the city switching to the Flint River as a water source in 2014.

Following the board's vote today, Genesee County Commission Chairperson, Jaime Curtis said, "This is a state, man-made disaster and we're going to ask the state to fix their disaster. Curtis also said, "Genesee County is the fifth largest county in Michigan and we will not be ignored."

Mayor Weaver hopes the county's show of support will convince the Governor to provide the City of Flint with financial support to help leaders address immediate infrastructure needs. Those needs include more than \$45 million to replace every identified lead pipe in the city, reimbursement of the \$2 million spent to switch back to the Detroit Water Sewerage Department, \$6 million to help with the transfer to the Karegnondi pipeline and additional resources to support the city's Heath Initiative to assist affected adults and children in Flint who have consumed water contaminated with lead.

In an interview with media after the board's emergency declaration Mayor Weaver said, "It's a victory and a step in the right direction." The mayor plans to meet with Governor Snyder in Lansing Thursday of this week to discuss the state's response and next steps.

- Michigan Department of Health and Human Services' Deputy Director of Field Operations, Sheryl Thompson, is working on obtaining several pallets of bottled water for drinking as well as "cans" of water that can be used for bathing, toileting, and cleaning only. The canned water is perfect for families experiencing large water bills and or possible shut offs.
- Genesee County Health Department distributed 100 PUR water filters to Hurley Children's Hospital for its first lead focused cooking class at the Flint Farmers' Market this past Saturday. The cooking classes were hosted by the MSU extension. Waiting is the plan after all testing? Using the recommendations from DEQ, which includes labor and staff overtime. Super will use recommendations. We don't funding so we are creating the plan.

If you have nothing new to share, please inform Hilda that you have no updates at this time.

- Today, Michigan Department of Health and Human Services (MDHHS) received approval from Department of Environmental Quality (DEQ) to allow the use and public display of the Bath Time Poster that was developed to address individuals' concerns about using the water to bathe their children (see attached). The Genesee County Health Department encourages all agencies to display the bath time poster.
- Hurley Children's Hospital with MSU extension will offer their first lead focused cooking class at the Farmers' Market this Saturday. Lead focused nutrition recipes and resource book will be distributed at the cooking class. Press release promoting the cooking class will go out tomorrow.
- Mott Children's Health Center continues to work with City of Flint to pick up PUR filters.

From Jamie Gaskin

Over the past 48 hours some additional support has started to surface given the National and regional media coverage. These are all developing streams of possible support and generally reflect organizations and business that got connected several months ago during our initial response. These are developing but I wanted to loop in all of you as this develops and also share some basic information:

1. MSP has again surfaced another source of bulk water that is Federal surplus. This water is free as long as we pay for shipping. I have looped in Bill Kerr at the foodbank as his team is really managing the logistics and understands the local demand and the ability of the local distribution system to handle storage etc.. These shipments come at the cost of shipping. This is about ½ the cost of buying the water and shipping ranges from between \$1000-\$2,000 per semi.
2. PUR – They have reached out to me again (Previously donated 2,000 faucet mount systems). I have directed them to consider donation of additional replacement filters and a financial donation. The financial donation would support shipping costs of more bottled water as well as possible prevention work.
3. ZeroWater – I am again working through some ideas with their CEO. He is very interested in the schools. I am not sure how this will develop.

\*As we have shared in the past the distribution system currently has supplies of filter mount systems (PUR & Britta), replacement filters (PUR & Britta), and 8 cup pitchers (ZeroWater). If we get to levels below 500 available units for any system it is my understanding that this will serve as a trigger for us to resource more.

I also want to share that I have about \$15,000 left of the more than \$275k donated. As I get closer to expending all the funds the UW will continue to evaluate our own internal investment and make some adjustments. Please direct any possible financial investors to support the water fund either by calling me directly or making even small donations on our website. I will also be working with Isaiah Oliver at the Community Foundation around the MI Health Endowment Funds. Both the United Way and the Community Foundation are committed to working together and trying to maintain maximum flexibility as the situation develops.

I will follow-up though the normal Health Department updates moving forward but I just felt it necessary to try to bring everyone up to speed on developing work. If you have any questions for me please let me know. I will be available all through the Holiday period via cell phone and I will only be out of town from Christmas eve through the following Saturday. Please do not hesitate to call me for any reason.

- City of Flint picked up Two Hundred (200) ZeroWater 8-Cup Filter Pitchers from Flint Community Schools 12/14/15 for distribution.

- The Genesee County Health Department has a total of 1,650 Pur water filters for distribution.
- Mott Children's Center will give City of Flint 117 water filters from the first batch of filters distributed at U of M Flint.
- Department of Health and Human Services and GCCARD attended the Health Fair on Saturday, December 12 and distributed the following at Bethel United Methodist Church's health fair.
  - 12 Filters
  - 17 Replacement Cartridges
  - 2 PUR replacements
  - 1 Pitcher
- Between December 11 and December 14, 2015, Genesee County Community Action Resource Department and Department Health Human Services distributed the following:
  - 78 filters
  - 6 pitchers
  - 53 replacement filters
- Sheryl Thompson from Michigan Department Health Human Services will order replacement filters when the inventory level reaches 500. After replacement cartridge order is placed, it takes a few days for delivery.
  - The Zero Water Pitcher replacement filters have been delivered. All sites will begin giving out a pitcher replacement filter with every Zero Water pitcher given out.

### Summary October through December 14, 2015

	Received	Distributed	Remaining
Water Filters	15,000	11,232	<b>3,768</b>
Water Pitchers	720	229	<b>491</b>
Replacement Cartridges	9,000	1,258	<b>7,742</b>

- Mott Children's Health Center distributed 117 PUR filters (that you attach to the faucet, [part of the batch that the United Way purchased and was distributed at U of M Flint).
- Mott Children's Health Center's leadership has put together a lead information packet. The intent of the packet is to distribute to patients. The packet includes information on appropriate filters and resources and how to obtain them. Genesee County Health Department will update Mott Children's Health Center as necessary with new distribution locations.
- As noted by Mott Children's Health Center, most parents of newborns continue to use bottled water to mix with formula.
- Genesee County Health Department continues to distributed water filters at its lead screening clinic in Burton.
- After a complete inventory is taken at all water filter distribution sites of remaining water filter cartridges, The State of Michigan has agreed to purchase additional PUR replacement filters.
- As of December 4, Michigan Department of Health and Human Services has distributed the following:

Water Filters	11,046
Water Pitchers	184
Replacement Cartridges	1,073

If you have nothing new to share, please inform Hilda that you have no updates at this time.

- Michigan Department of Health and Human Services and Genesee County Community Action Resource Department have distributed the following in November: water filters 778, Zero

Water Pitchers 63, and replacement filters 924. Total filter distribution as of October 1 is 10,951.

- The MDEQ and the City are coordinating the distribution and analysis of containers (bottles) for water testing. Bottles are available at City Hall and the water plant. Genesee County Health Department does not have bottles for distribution. Customers' name, phone, and address are required to be documented on a form when the water sample is submitted for analysis, not when the bottle is picked up. Analysis is conducted in Lansing at the MDEQ lab.

We are asking all partners included in this email to provide any pertinent updates **DAILY** to Hilda McShane by 2:00pm. If you have nothing new to share, please inform Hilda that you have no updates at this time.

- Genesee County Health Department (GCHD) will distribute an additional 100 water filters to the City of Flint for distribution at City of Hall.
- Besides all the water filter distribution occurring at the blood lead screening clinics and offsite exhibits by Genesee County Health Department's staff, the Health Department continues to distribute water filters at its Burton WIC clinic and continues to educate parents on lead in water issues. Distribution at the WIC clinic has been swift and additional inventory, another 100 water filters, will be added to the WIC distribution inventory.
- Genesee County Health Department will distribute a press release that supports Professor Marc Edwards, of Virginia

Tech University's announcement that Flint residents do indeed need to continue to use water filters.

- After a through inventory of water filters, Michigan Department of Health and Human Services (MDHHS) will purchase more Pur replacement filters. As suggested by MDHHS staff, GCHD will inventory its supply of replacement filters and give inventory outcome to MDHHS.
- Genesee County Health Department will host blood lead screening clinics at Grace Emmanuel and Bethel United Methodist churches.

Genesee County Health Department is working with the CDC to develop phosphate educational materials.

United Way (UW) CEO, Jamie Gaskin and Genesee County Health Department Health Officer, Mark Valacak have been discussing the strategic use of Americore volunteers during this water crisis. Suggested volunteer work includes: distribution of filters, lead education, and assist at health fairs and at church exhibits. Volunteers may be available in February of 2016.

UW Jamie Gaskin reported that UW will giveaway 110 Thanksgiving baskets. The baskets will contain a water filter system.

For those who need 8oz - Zero cup water filters, please contact Tony Sitko at Flint Community Schools. His email address is: [tsitko@flintschools.org](mailto:tsitko@flintschools.org).

Genesee County Health Department will give City of Flint 50 PUR water filters for distribution at City Hall.

Water filter distribution is well over 13,596.

BJ Roach from the State Police had nothing to report at this time.

**Subject:** Genesee County Health Department EOC 11/5/15

This is an informational update and the Genesee County Health Department will provide these updates on a daily basis after 4 pm. We are asking all partners included in this email to provide any pertinent updates **DAILY** to Hilda McShane by 2:00pm. If you have nothing new to share, please inform Hilda that you have no updates at this time.

- Genesee County Health Department's (GCHD) Women, Infant and Children (WIC) program has distributed 300 water filters.
- Sixty water filters and replacement cartridges were distributed at yesterday's lead screening clinic.
- There was an additional three lead clinic participants at Genesee County Health Department's lead screening clinic hosted by Genesee County Health Department and McLaren Health Plan on Thursday, November 5 in Burton, Michigan. The final total for this lead screening clinic is 42 participants.
- There was a correction made to abc12's segment covering the lead screening program that was corrected on GCHD's social media platforms. Abc12 will make the correction at their end as well.

I can send whatever you need to my VFC Providers and Non-VFC Provider email lists. I also have an OB/Gyn email list.

My program secretary should be able to change the news screen on MCIR.....

Let me know what I need to do.

There are actually 5 people at the Health Department with permissions to send messages on the MIHAN. I would be happy to do it, provided I was given the exact message/attachments to send.

Also – in Genesee County, the MIHAN is not widely used by the medical community. I did a quick search of Genesee County located users with medical/healthcare, etc. as one of their roles. Of the 45 users that came up, @21 of them are staff at long term care/skilled nursing facilities. Of the remaining, most of them are hospital staff (administration and/or ER staff) or Hamilton staff. There is only one pediatrician that I know of from Genesee County on the MIHAN.

You each received, along with Eden Wells, what I received from the Genesee County Medical Society. I had sent this earlier there to Pete Levine, so I am thinking he sent this out to all members.

April, you would probably have to put this on the HAN alert.

It is harder to make contact with the Genesee County Osteopathic Society, but I will keep trying.

Toni, what other “providers” were you thinking about?

December 23, 2015

The Honorable Jim Ananich  
Senate Minority Leader  
State Capitol, Room S-105  
Lansing, Michigan

Dear Senator Ananich:

Enclosed are answers to the questions you posed in your October 20, 2015 letter to our office regarding the audit we are conducting of the Office of Drinking Water and Municipal Assistance (ODWMA), Department of Environmental Quality (DEQ), specific to lead contamination in the City of Flint's drinking water. Also enclosed are additional questions we developed that are relevant to these issues, along with five exhibits:

- A map showing Flint water samples by zip code.
- A map showing lead counts of 5 parts per billion or higher.
- Two charts showing the number of samples by time period and zip code.
- A time line of the Flint water review.

We appreciate the opportunity to assist you in answering questions regarding this topic. If you have further questions or a request for other services, please do not hesitate to contact our office.

Sincerely,

Doug Ringler  
Auditor General

Enclosures

**Q1: How does ODWMA ensure the data it receives is accurate?**

A: With regard to the United States Environmental Protection Agency (EPA) Lead and Copper Rule (LCR) monitoring requirements, DEQ relies on the following key controls to ensure the accuracy of test results:

- State-owned laboratories test water samples.
- State-owned laboratories send test results directly to DEQ.
- The City of Flint Water Treatment Plant (Flint WTP) certifies whether sample sites are classified as tier 1\*.

The current Flint WTP LCR sampling process includes:

1. DEQ informs the Flint WTP of the required water lead and copper sample size.
2. The Flint WTP determines the pool of tier 1 sites for sampling.
3. The Flint WTP selects the sample.
4. The Flint WTP sends out sample kits and instructions to residents for collecting water samples.
5. Residents leave samples and signed sampling forms outside their front doors.
6. The Flint WTP employee picks up samples and forms from residents.
7. The Flint WTP employee reviews sample forms for completeness.
8. The Flint WTP employee sends samples to the State-owned laboratories.
9. State-owned laboratories test samples and provide results directly to DEQ.
10. DEQ receives water lead and copper sample results, which include the following information: date collected, date received, address where collected, type of residence (e.g., single family or apartment), and sample point (e.g., kitchen sink or bathroom sink).
11. DEQ tracks, and follows up if necessary, the number of samples collected by the Flint WTP to help ensure that the required minimum number of samples are collected by the monitoring period deadline.

---

\* Single-family or multiple-family residence with lead service line, lead solder copper piping constructed after 1982, or lead plumbing.

12. The Flint WTP submits lead and copper report to DEQ that certifies whether sample sites meet tier 1 criteria.
13. DEQ prepares the LCR 90th percentile calculation report.

During our review, we noted two potential improvements for the Flint WTP sampling process (see Question 5 of the additional questions answered by the OAG regarding tier 1 sample validity):

- DEQ could verify that the sampling pool was limited to only tier 1 sample sites to ensure that the Flint WTP is in compliance with the LCR (Title 40, Part 141, section 86(a)(3) of the *Code of Federal Regulations* [CFR]).
- DEQ could independently verify the validity of sample site certifications.

**Q2: What accountability measures are in place for ODWMA staff who fail to follow data verification protocols?**

A: DEQ does not provide any direct oversight over the Flint WTP and, therefore, does not have any accountability measures over the Flint WTP's LCR data verification protocols. DEQ's data verification protocol for lead and copper water sampling is limited to verification that the WTP certifies samples submitted to the State-owned laboratories for analysis (see steps 7 and 12 in the Flint WTP LCR sampling process noted in Question 1 above). We did not identify any instances in which ODWMA staff failed to verify that submitted samples were certified by the Flint WTP.

**Q3: What accountability measures are in place for ODWMA staff who lie or misrepresent information to the EPA?**

A: As with all classified employees, ODWMA staff must adhere to the rules and regulations established by the Michigan Civil Service Commission. If any ODWMA staff were determined to misrepresent information to the EPA, they would be subject to Civil Service Rule 2-6, Discipline, which allows an appointing authority to discipline an employee for just cause up to and including dismissal. We are not aware of any DEQ-established measures that are in addition to the Civil Service Rules.

We gained access to the e-mail accounts of key DEQ management (DEQ Director, Deputy Director, ODWMA Chief, and other key ODWMA staff) extending back to January 1, 2013. We did so to identify the key decision points and conversations that occurred leading up to and through the situation in Flint. Our review was also intended to determine whether State, Flint, or other officials attempted to conceal key test results or other information.

We noted one e-mail exchange between DEQ and the EPA that appears to be a significant contributor to the concern that DEQ misrepresented information to the EPA. The EPA requested clarification on February 26, 2015 regarding the type of optimized corrosion control **treatment** the Flint WTP was using. DEQ responded on February 27, 2015 that the city had an optimized corrosion control **program** in place, but DEQ did not provide any program details. DEQ informed us that the Flint WTP corrosion control **program** included performing

lead and copper monitoring for two consecutive six-month periods to determine whether corrosion control **treatment** would be necessary in the future. However, it appears the EPA interpreted corrosion control **program** to mean that corrosion control **treatment** was being performed.

On April 23, 2015, the EPA again inquired as to what the Flint WTP was doing for corrosion control **treatment**. DEQ responded on April 24, 2015 that the Flint WTP was not practicing corrosion control **treatment**.

Based on our review of this and other e-mails, we have no specific reason to believe that DEQ willfully misrepresented the information to the EPA.

**Q4: What policies do DEQ and ODWMA have in place to escalate major infractions up the chain of command?**

A: We did not note any instances of major infractions (i.e., intentional disregard of policies, laws, regulations or specific directions) committed by DEQ staff during the course of our review. DEQ does not have a formal policy or procedure in place to escalate major infractions performed by ODWMA employees; however, our review of DEQ correspondence confirmed the escalation of key issues up the chain of command related to the Flint situation. DEQ stated that its informal policy is for staff to notify the proper level of management of infractions to determine necessary action.

**Application of the LCR**

**Q1: How did the Flint WTP become the primary water supplier for the City of Flint?**

A: Upon notification of the City of Flint's plans to switch to the Karegnondi Water Authority (KWA) in April 2013, the Detroit Water and Sewerage Department (DWSD) submitted a letter to the City of Flint stating that it would terminate its agreement to provide water services on April 17, 2014.

According to DEQ management, the Flint WTP attempted to negotiate with the DWSD to maintain it as the City of Flint water supplier; however, after negotiations were unsuccessful, the City of Flint notified DEQ through a permit request of its intent to operate the Flint WTP full time using the Flint River. Although the Flint City Council voted in March 2013 in support of moving to the KWA pipeline, the vote was silent on the use of the Flint River as a temporary drinking water source.

DEQ informed us that in the 1990s, the City of Flint upgraded the Flint WTP to serve as a backup source of water for emergencies. In 2006, the Flint WTP began quarterly testing of the treated Flint River water at the Flint WTP to ensure water quality standards were met; however, the Flint WTP did not test the water's effect on the distribution system at consumer tap locations.

**Q2. Did DEQ consult with the EPA prior to determining how to apply the LCR?**

A: DEQ did not consult with the EPA on how to apply the LCR prior to implementing two consecutive six-month monitoring periods of the Flint WTP beginning July 1, 2014. Based on past experiences applying the LCR monitoring requirements, DEQ believed that it had appropriately applied the LCR requirements of a large water system.

**Q3: When Flint switched to the Flint River water source, should corrosion control treatment have been maintained?**

A: We believe that corrosion control treatment should have been maintained.

According to the LCR, a water system can achieve optimized corrosion control if it submits results of tap water monitoring for two consecutive six-month monitoring periods with acceptable lead levels. However, a water system that has optimized corrosion control, and which has treatment in place, should continue to operate and maintain optimal corrosion control treatment.

DEQ staff explained that they did not treat the switch to Flint River water as a new system, but as a new source. DEQ further stated that because the Flint River was a new water source and there was a change in chemicals needed to treat the new source, a corrosion control study was needed to determine the impact on the water distribution system. Therefore, it was DEQ's interpretation that two rounds of six-month monitoring were still needed to evaluate the water quality and determine optimal corrosion control treatment.

The Flint water system had optimal corrosion control treatment when the DWSD WTP was the water supplier. Based on our review of notes from a July 21, 2015 EPA and DEQ conference call on DEQ's implementation of the LCR regarding whether the Flint WTP should have continued to maintain corrosion control treatment, it appeared that the EPA did not agree with DEQ's interpretation of the LCR. Region 5 EPA staff explained that they would talk to the EPA headquarters about the interpretation of regulations and believes that systems that have been deemed optimized need to "maintain" corrosion control. The Region agreed to provide supporting regulatory citations for the language about maintaining corrosion control.

On November 3, 2015, the EPA issued a memorandum stating that the LCR had differing possible interpretations; however, the EPA concluded that it is important for large water systems to take the steps necessary to ensure that appropriate corrosion control treatment is maintained at all times, thus ensuring that public health is protected. Based on this clarification, it appears that corrosion control treatment should have been maintained.

**Q4: Should DEQ have required the Flint WTP to start pursuing optimized corrosion control treatment after the first round of six-month sampling results were above the lead action level of 5 parts per billion (ppb)?**

A: Yes. According to DEQ's application of the LCR, within six months after the end of the monitoring period in which the water sample results exceeded the acceptable lead level, DEQ should have required the Flint WTP to start pursuing optimized corrosion control treatment.

The LCR states that the lead action level is exceeded if the lead level, as determined by the 90th percentile calculation, is greater than 15 ppb. If the lead action level is exceeded, water systems are required to take additional actions including educating the public about lead in drinking water as well as commencing lead service line replacement if the water system has already installed corrosion control and/or source water treatment. However, for water systems that have not yet implemented corrosion control treatment, they can be deemed to have optimized corrosion control without installing treatment if they can demonstrate lead levels below 5 ppb for two consecutive six-month periods.

The first round of six-month sampling results was received in late March 2015. Because the results were 1 ppb over the lead action level of 5 ppb, DEQ would not be able to achieve two consecutive six-month periods below 5 ppb. Therefore, DEQ should have notified the Flint WTP to start pursuing optimized corrosion control treatment. However, DEQ waited until the second round of sampling was completed (June 30, 2015) to assess whether water sample results improved.

#### **Water Samples**

**Q5: Did DEQ verify that only tier 1 sample sites were selected by the Flint WTP in the two rounds of six-month samples?**

A: DEQ did not verify that only tier 1 sample sites were selected. DEQ relies on the Flint WTP's certification of sample sites and does not perform any independent verification of those certifications.

In a November 19, 2015 *Flint Journal* article, the Flint WTP indicated that it did not have the ability to ensure that all sites were tier 1. In fact, water samples came from the random distribution of 175 testing bottles without regard for whether the homes were at risk for high lead levels. DEQ issued a formal memorandum on November 9, 2015 requesting that the Flint WTP verify the classification of all prior sample items. The results are due back from the Flint WTP on December 30, 2015.

**Q6: DEQ dropped two water sampling sites from its second six-month sample (January 1, 2015 through June 30, 2015). Was this appropriate?**

A: Yes, it was appropriate for DEQ to drop these two water sampling sites. Federal regulation 40 *CFR* 141.86(a) states:

" . . . each water system shall complete a materials evaluation of its distribution system in order to identify a pool of targeted sampling sites that meets the requirements of this section . . . All sites from which first draw samples are collected shall be selected from this pool . . . Sampling sites may not include faucets that have point-of-use or point-of-entry treatment devices designed to remove inorganic contaminants."

This regulation also requires that a water system's targeted sampling pool consist of only tier 1 sampling sites if an adequate number is available to meet monitoring requirements.

According to federal regulation 40 *CFR* 141.86(f), the State may invalidate a water sample if it determines that the sample was taken from a site that did not meet the site selection criteria. A sample invalidated per this regulation does not count toward determining lead or copper 90th percentile levels or toward meeting the minimum monitoring requirements.

DEQ dropped one water sample site from its 90th percentile calculations because the site was from a business that does not meet the tier 1 requirements of being a single-family or multiple-family residence. The second sample site was dropped because the home had a point-of-entry treatment device to filter contaminants. Based on the criteria specified above, it appears that DEQ's rationale for dropping the samples from these two sites appropriately met the requirements for invalidating samples per federal regulation 40 *CFR* 141.86.

**Q7: Was flushing of the taps the night before drawing a sample an appropriate sample methodology?**

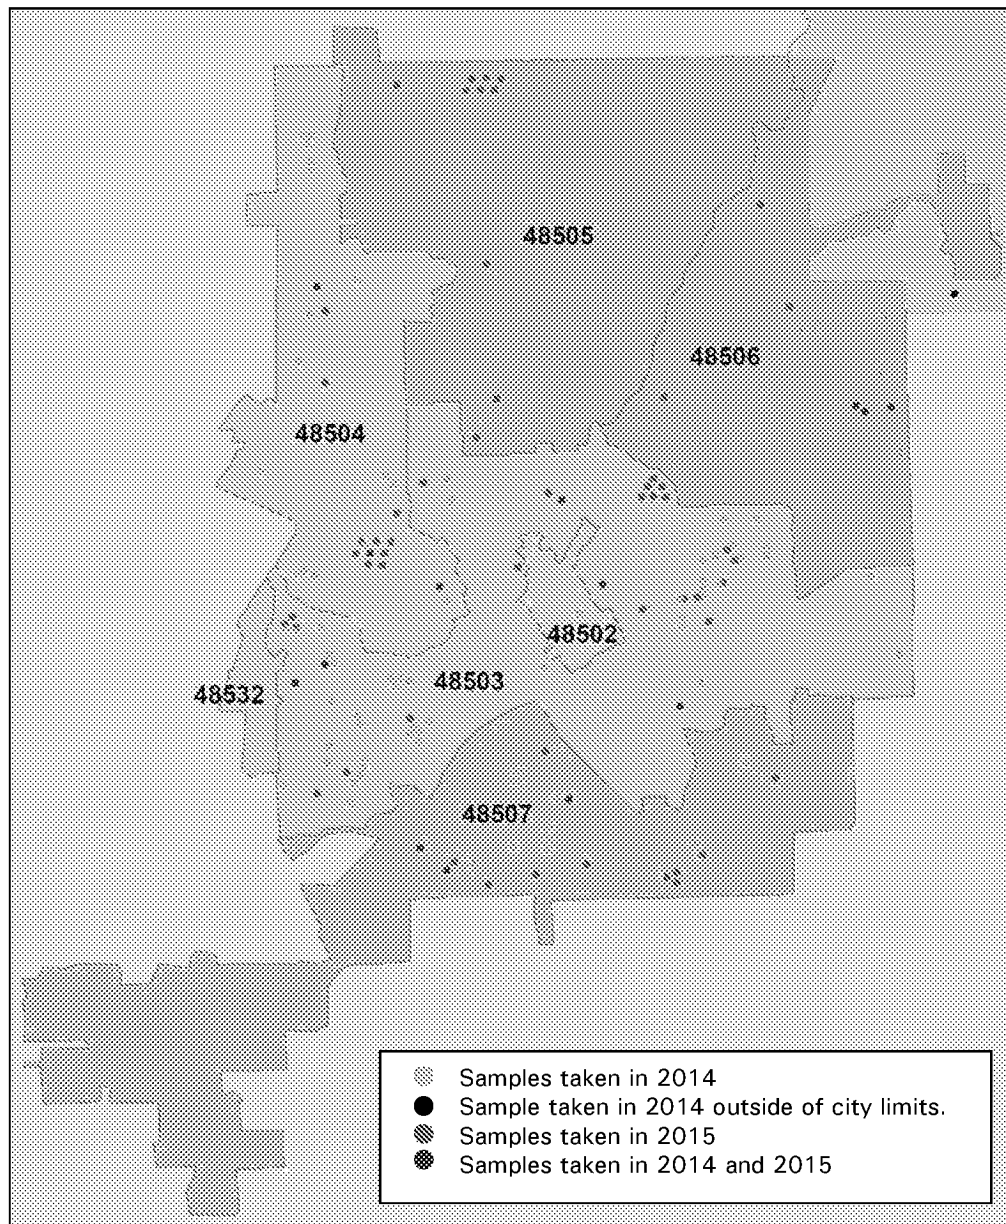

A: Yes. The LCR requires that samples be a first draw of water after six hours of stagnation. The LCR does not indicate whether or not the water line should be flushed prior to collecting the sample. In the sample instructions, DEQ required preflushing to ensure that sampled faucets were not stagnant for an excessive period of time beyond the targeted six hours (e.g., rarely used faucets or when a homeowner has been gone for an extended period of time.)

The LCR requires six hours of stagnation; however, it does not preclude DEQ from instructing residents to flush prior to stagnation.

In calendar year 1992, the Flint WTP established a tier 1 sample site pool for LCR monitoring. With the change to the Flint River water, the Flint WTP needed to increase the pool of sample locations because of additional sampling requirements. The following exhibit documents the 2014 and 2015 sample locations for LCR monitoring. Based on the data obtained during our review, we could not determine how the locations were selected or whether they were properly classified as tier 1 sample sites.

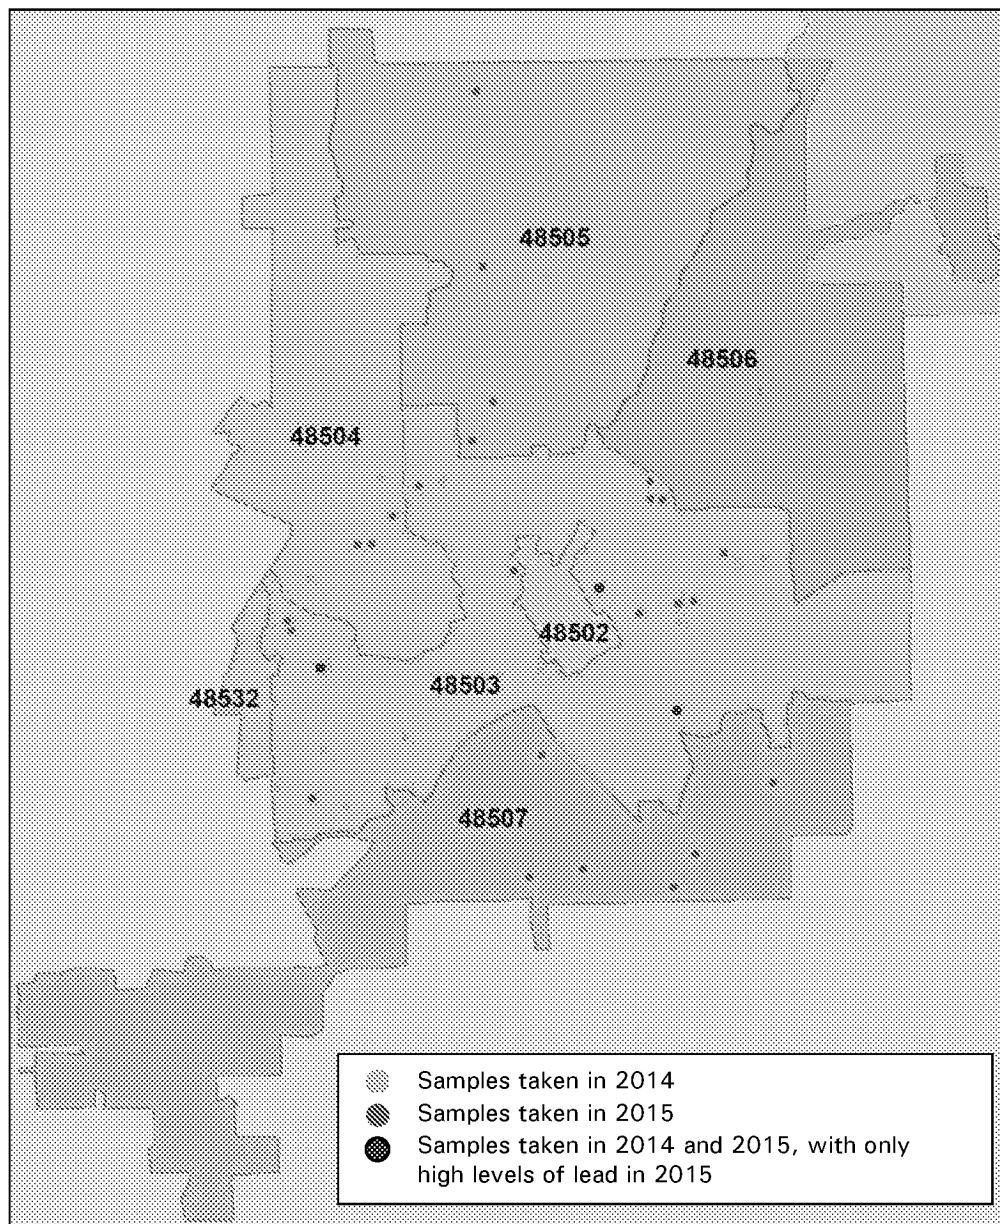

As noted in Question 5 of the additional questions answered by the OAG, DEQ has requested the Flint WTP to verify the tier 1 classification of all prior sample items.

Source: The OAG prepared this map using data obtained from DEQ and ©OpenStreetMap contributors (opendatacommons.org). The sample locations are approximate.

This exhibit documents the 2014 and 2015 sample locations with lead counts of 5 ppb or higher. This information is used in aggregate by DEQ to determine if the city has optimized lead levels.

Source: The OAG prepared this map using data obtained from DEQ and ©OpenStreetMap contributors (opendatacommons.org). The sample locations are approximate.

## Flint WTP 2015 Number of Samples by Time Period and Zip Code (Exhibit #3)

This chart expands on Exhibit #1 to show a summary by zip code and time of selection within the sampling period. Based on the data obtained during our review, we could not determine if the lateness of selection within the monitoring period affected the appropriateness of the sample items.

Source: The OAG prepared this chart using data obtained from DEQ.

**Importance:** High

And Genesee County and the Genesee County Health Department, have just issued the attached public health advisory and on the final paragraph it says:

Recent data provided by Hurley Hospital researchers has indicated that a significant increase in blood lead levels has occurred in children since the switch to Flint River water. The county Health Officer has requested that the Michigan Department of Health and Human Services (MDHHS) provide to the County specific data to support its claim that state data is more comprehensive and does not show a significant increase. To date, the MDHHS has failed to confirm the geographic area included in their findings. We want to assure the state data is specific to the boundaries of the City of Flint, and not Flint addresses which would include addresses in areas outside of the City of Flint. These areas, such as Flint Township, that obtain their water from the Detroit Water Authority and would, therefore, not be representative of Flint River water as the water source. The County is prepared to take further action if the State fails to provide the requested data by September 30, 2015. Further action could include a request for outside independent evaluation of the data and to declare a Public Health Emergency in Flint.

I understand that we are still reviewing the data—but the county has basically issued a ransom date that they want this information by tomorrow.

Eden—please coordinate an answer so Nick can walk into the 1:00 p.m. meeting prepared on this.

Eden, Elizabeth, Geralyn, and Sue,  
Below is the draft response we would like to send to the US Senate inquiry on how are we assisting WIC clients.

Please review and send me any comments.  
Thanks,  
Rashmi

**Importance:** High

Hi Rashmi – Per your phone call, here's a draft reply to review :

Jacqlyn

Thank you for your 10/2/15 email to Michigan WIC regarding the water situation in Flint. Our Michigan Dept. of Health & Human Services has been in regular contact with the local health department and working on the issues. Here are some key updates:

Genesee County reports their WIC nutritionists are currently assessing whether or not clients have access to safe water. They first screen to determine which clients live in city (apparently this about 50-60% total caseload), and then ask if they have access to bottled water. They indicated that the majority of clients who are reconstituting infant formula with water are already using bottled water.

Filter Distribution: United Way is giving the County Health Dept. 4,000 filters. The Health Dept. is targeting this distribution to WIC clients They are planning to have a distribution even on Fri and Sat—possibly at U of M Flint.

Lead Testing: Blood Lead testing for kids is currently done adjunct with WIC clinics. Also, Hurley does a good job of already testing their kids. Additionally, they are working on a plan to have McLaren Health Plan do additional testing.

We will continue to monitor the overall situation and work with the local health department on this situation. Thank you.

**Subject:** RE: Inquiry from U.S. Senate on Situation in Flint

I am checking with Eden. It seems like we can only say what we think the GCHD is doing for WIC clients or we refer her to the GCHD.

**Subject:** Situation in Flint

Hi Stan,

Hope you are doing well. I just wanted to check in with you on the situation in Flint. Our office has been getting calls about the water situation and I'm curious what advice, if any, you all are giving to WIC parents. Have you all explored allowing ready-to-feed formulas or do you feel confident that the water filters being provided by the state are sufficient to address the concerns about lead?

Hope all is well!

Great! Ok- good- and CLPP funding would be great- but do not feel you have to represent MDHHS ( our liaisons have their own connections) but the more they hear things from folks outside of DHHS is great! I will find out if our folks want to have a thing else brought up!

## Executive Summary for a Health-Based Drinking Water Lead Level

October 26, 2015

**Objective:** Identify health-based drinking water lead level(s) to allow re-opening of school and/or daycare water fountains/faucets for student use.

### Public Health Assumptions Included in the Model

The model estimates are only accurate if the following assumptions are met:

1. Children are not exposed to lead paint chips or lead paint dust (at home or elsewhere).
2. Children's drinking water at home is filtered and contains no more than 1 ppb of lead.
3. Children are exposed to lead soil concentrations typical of the urban environment in Flint (i.e. soil has not been impacted by lead-based paint).

Children's risk of having an elevated blood lead level will be greater than the model estimates if these assumptions are not met.

### Resulting risk from drinking water with the following lead concentrations:

The goal is that a child should have ***no more than a 5 percent risk*** of having a blood lead level greater than 5 micrograms per deciliter.

Risk of a child having an elevated blood lead level		
Daycare or School Drinking Water Lead Levels	less than 1 year old	less than 7 years old
2 ppb	5 percent	3 percent
5 ppb	6 percent	4 percent
11 ppb	8 percent	5 percent
15 ppb	10 percent	6 percent
30 ppb	18 percent	11 percent
100 ppb	55 percent	42 percent

**MICHIGAN DEPARTMENT OF HEALTH AND HUMAN SERVICES (MDHHS)**  
**SUMMARY OF BLOOD LEAD LEVEL TEST RESULTS FOR FLINT ZIP CODES 48501-48507**  
**AS OF OCTOBER 30, 2015**

**Executive Summary**

This report is generated by MDHHS to track Blood Lead Level test results in Flint, Michigan.

- Counts on this report include both capillary and venous blood tests. People who have had multiple tests are counted only once.
- Since 10/1/2015, an additional 963 people have been tested in Flint.
- Continued testing efforts by Genessee County Health Department, MDHHS and local medical personnel have identified 18 children with blood lead levels greater than or equal to 5ug/dL since 10/1/2015.
- 3% of the children younger than 6 years old tested since 10/1/2015 have had blood lead levels greater than or equal to 5ug/dL.
- Additional testing is ongoing. Counts may vary slightly as new results are added.

**Number of People Tested for Lead in Flint**

Total number of people tested for lead from 4/15/2014 to 9/30/2015	5017
Total number of people tested for lead since 10/1/2015:	963

**Children Younger than 6 Years Old with Blood Lead Levels (BLL)  $\geq$ 5ug/dL**

Total number of children tested for lead from 4/15/2014 to 9/30/2015:	4156
Number of child BLL test results $\geq$ 5ug/dL from 4/15/2014 to 9/30/2015:	181
Total number of children tested for lead since 10/1/2015:	385
Number of child BLL test results $\geq$ 5ug/dL since 10/1/2015:	12

**Adults with Blood Lead Levels (BLL)  $\geq$ 5ug/dL**

Total number of adults tested for lead from 4/15/2014 to 9/30/2015:	207
Number of adult BLL test results $\geq$ 5ug/dL from 4/15/2014 to 9/30/2015:	13
Total number of adults tested for lead since 10/1/2015:	289
Number of adult BLL test results $\geq$ 5ug/dL since 10/1/2015:	6

**Children 6 to 18 Years Old with Blood Lead Levels (BLL)  $\geq$ 5ug/dL**

Total number of children tested for lead from 4/15/2014 to 9/30/2015:	654
Number of child BLL test results $\geq$ 5ug/dL from 4/15/2014 to 9/30/2015:	7
Total number of children tested for lead since 10/1/2015:	289
Number of child BLL test results $\geq$ 5ug/dL since 10/1/2015:	6

- Water sampling protocol no longer includes pre flushing of lines
- Developing enhanced strategies to accelerate BLL testing of children 0-6

**Flint Water Public Health Response: MDHHS Action Plan**  
**Weekly Update 11-20-15**

TASK	STATUS	ACTION	DATE COMPLETED
<b>Filter Distribution</b>	Residents may continue to obtain filters from GCCARD (both sites 9-4PM) and MDHHS clients can continue to obtain filters at the two MDHHS office locations or the GCCARD sites.	No action indicated.	NA
<b>Filter Replacement Distribution</b>	The procedure is in place for replacement cartridge distribution including an abbreviated application for residents to apply for and obtain cartridge replacement. Cartridge replacement will occur at same locations as filter sites. DHHS is also placing an order for 750 replacement filters for the 8-cup Zerowater filters. 9000 Brita replacement filters on hand with an additional 10,000 readily available when needed. Total available= 19,000	DHHS and GCCARD will begin issuing the replacement filters the week of November 2 <sup>nd</sup> .	<b>Ongoing</b>
	MDHHS is currently coordinating with GCARD on publicity for distribution of the replacement filters. United Way will provide Pur Filter Replacements. United Way will also be purchasing filter units for school water fountains. Press release planned Monday 11/2 re: pick up of replacement filters, videos to be posted on websites and you tube.	Jen Eisner will work with Hilda McShane	Completed 11/2
	<b>United Way requested that DHHS purchase Pur filter replacements. GCARD requests that no more bottled water be donated. They have plenty in stock. Cash is preferred. City of Flint set up distribution point in City Administration office building. GCHD will be providing City of Flint with Pur Filters. The Brita filter requires a form for MDHHS be filled out; there are some concerns that undocumented members of population will avoid Brita filters for this reason.</b>	No action indicated.	
<b>Public Education Proper Filter Use</b>	When used improperly, the filters will exceed their capacity limit in a much shorter time frame thereby increasing need for filter replacement much sooner than expected. Develop NEW public education material about proper use of cartridge AND how to obtain filter replacement cartridges, targeted for release week of October 26 during lead awareness week.		Completed
	Request made for written instructions on filter cartridge replacements for nurse case		<b>Completed</b>

TASK	STATUS	ACTION	DATE COMPLETED
	managers to take on home visits. Wes is working to complete a packet for nurse case managers which will include information on filters.		
	Video created with Home Depot demonstrating replacement of the Brita replacement filter. DEQ receiving questions about meters on the water filter pitchers delivered to the schools which are likely Zerowater Filters.	The video added to the gov/flintwater website.	Completed 11/2
	Video will be added to nurse training- CLPPP.		Completed 11-10
<b>Lead Testing Protocol:</b>	<p>Draft protocol has been completed, undergoing final review. Protocol calls for testing:</p> <p>Priority groups-</p> <ul style="list-style-type: none"> <li>• Confirmatory venous testing for children who had venous testing (115 children)</li> <li>• Children in day care, Head Start</li> <li>• children attending 3 schools (Freeman, Eisenhower, Brownell)</li> <li>• Children residing in high risk zip codes (03, 04)</li> <li>• All other students</li> </ul> <p>Protocol will be announced in a joint MDHHS/GCHD Press release.</p>	Press release has been cleared with Governor's Office.	Completed 10-28
<b>Blood Lead Testing: 9/28/15-10/23/15</b>	<p>CLPPP processed 580 tests from Flint zip codes since 9-28-15; 5 children were reported with elevated lead blood levels.</p> <p>There approximately 200 children that have been identified for follow-up.</p>	MDHHS has arranged a contract with the GCHD to provide nurses for the follow-up.	Contract completed in E-grams as of 10-23
	Cross reference list of children with elevated lead levels with filter distribution data to ensure household has a filter. (Peeler/Scott) So far only about 20% of approximately 200 children with EBL are known to have received a filter. GCHD will deliver filters to these homes as they are doing the case follow-up. GCHD will provide weekly updates.	Send list to Kris S (done)	In process
	<p>A group will develop reporting metrics and system to track same: Linda Dykema, Wes Priem, Michele Bruneau, Bob Scott and group met to discuss metrics. Plan to produce first detailed report for internal review the week of Nov. 9<sup>th</sup>. A simplified version for external dissemination will be released after internal review.</p> <p>Linda is working on an analysis of blood lead tests done since 9-28-25. Epi will assist with this analysis. Still fine-tuning the report. Report has been completed along with talking points.</p>	<b>Completed</b>	<b>Completed</b>

TASK	STATUS	ACTION	DATE COMPLETED
	Draft press release and BLL report (for period 10/1/15-10/30/15) completed. DEQ and Governor's office will be briefed prior to release.		Pending
	Reach out to MSA to discuss maximum effort to promote blood lead testing of children 0-6	Pending	
Parent education	Parent education material completed. Discuss dissemination of parent material through Flint schools.	Call with Flint school superintendent, GCHD, and MDHHS scheduled 10-26-15 to discuss dissemination process.	Completed
	Schools require 6000+ information packets for distribution to all students. Print order sent to DTMB.  Hardcopy will be distributed to GCHD for issuing to the schools, and to Headstart, daycare, and other agencies in Flint with children ages 0-5. Mark will drop off hard copies at GCHD. Toni LaRocco will take the lead in distribution of the materials to the schools and other agencies.	Geralyn Lasher arranged for printing.	10/30 printing completed and Mark dropped off 6,000 copies at the Flint School Admin. Building, and 2,500 to health dept. Remainder dropped off on 11/2.
	Ensure legislators receive material in advance	Elizabeth Hertel coordinate legislator notification	Completed
Provider Education	Provider Education material completed. Communication to providers will occur through GCHD and MDHHS networks (GCMS, GCARD, hospitals, etc).MDHHS will distribute through the Medicaid Health Plans. Hurley providers received the packet and the remainder of providers will receive the information next week. TASK	STATUS	ACTION	DATE COMPLETED
		listservs next week.	
	<b><u>A webinar for health care providers will be held in early December to discuss the Lead issue, blood lead testing, Ready to Feed Formula, and answer any questions. It will be co-sponsored by the GCHD medical director.</u></b>		
<b>Community public education and testing event</b>	<p>McLaren Health Plan in conjunction with GCHD hosted a public testing and awareness event on November 5 at the Burton GCHD site. 40 children were tested. McLaren will have providers on site to perform testing for their members; GCHD onsite to perform testing for all others. Event will also include Medicaid application assistance.</p> <p>Tony Larocco (GCHD) has contacted Molina and Meridian Health Plan regarding sponsorship of community testing and awareness event.</p> <p>Molina and Meridian Health Plan testing dates to be determined.</p> <p>GCHD will be at a community event on Nov. 12, from 2 PM to 7 PM, to focus on testing for children 0-5. (Brownell and Holmes Schools)&gt;</p> <p>Another testing event was held at Brownell School on 11/12. Many organizations were present to provide information and services. 27 children were tested, 60 filters distributed. <b><u>There was only one EBL result from the Brownell clinic (5.5 ppb that will be reported out as a 6.0; McLaren results are not available yet.) Flint schools superintendent is interested in having another event.</u></b></p>	Dr. Forschee has been contacted. Tony contacted Molina and there is interest in a future testing event.	<b>pending</b>
	<p>There will be a combination school testing/townhall/education event, sponsored by Rep. Neeley, on Nov. 2<sup>nd</sup>.</p> <p>A telephonic townhall is slated for Oct. 28 by Rep. Neely. Gongwer reported that 4,000 people participated in this call.</p>	FYI	Completed
<b>Public Education Materials</b>	<p>Mark Johnson, is the regional representative for ASTDR and CDC. He has been designated as contact. A call was held with ATSRDR on 11/13 to discuss how to improve outreach efforts to the Flint community about lead hazards. It was suggested that state/county consider lowering the readability level of the lead materials for the public to 3<sup>rd</sup> or 4<sup>th</sup> grade reading level. <b><u>A workgroup is currently reviewing the documents for needed changes. Jim Henry contacted Dr. Suzanne Selig (UMichigan-Flint School of Public Health) who will seek community feedback on the materials that have been developed. After readability</u></b></p>	CLPPP and GCHD staff will review documents and work with the communication office on any changes.	<b>Pending</b>

TASK	STATUS	ACTION	DATE COMPLETED
	<u>changes, some of the materials will be translated into Spanish and Arabic.</u>		
<b>Environmental Investigation</b>	<p>\$275 k contract with ETC requested on Oct. 21<sup>st</sup>, 2015. About 275 EBL investigations are budgeted for Flint. Wes will work with GCHD to coordinate with Flint Housing/other authorities to deal with recalcitrant landlords.</p> <p>DEH meeting on 11/5 with MDEQ staff to harmonize EBL investigation protocol with water testing protocol. 11/12 The EBL contractor met with GCHD staff to coordinate activities with case management.</p> <p><u>The EBL investigation activities require a substantial amount of time (4 hours), less than that for the case management activities; however, the team is arranging joint visits where possible.</u></p>		Contract completed 10/29
<b>Nurse Follow Up</b>	<p>Project sent to Contracts for inclusion in E-grams 10-23-15. 10-21-15 Funding for case management nurses will be disseminated to GCHD through new project: <i>Flint Water</i>, for \$425,000 through the Comprehensive Contract E-grams system, to fund the: Follow-up of Children Reported with Elevated Lead Levels: Case Management Services. GCHD advised to secure approvals for use of these funds and begin procedures to place staff in appropriate positions to conduct the work.</p> <p>GCHD has shifted one nurse over for follow-up. That nurse is fully trained on elevated lead patient management. 1.5 nurse FTE's will be assigned and trained on 11-10-15.</p> <p>Lead Safe Home Program worked with GCHD on protocol to harmonize the flow of outreach to families with children with elevated blood levels. 11/10 Training has been completed for 2.5 FTE nurses. Some follow-up training will be scheduled as well. <u>Follow-up training with nurses was completed on 11-17. Weekly calls have been set up with CLPPP staff and nurses.</u></p> <p><u>Weekly status report from GCHD attached in separate file.</u></p>	<p>Eden will contact Bob to send the list to Toni at GCHD so they can facilitate case management of children with elevated lead levels (done). Contract approved 10/26</p>	<p>Completed 10/27</p> <p>Completed 11-10</p>
<b>Water Testing</b>	<p>DEQ will be testing at Freeman Elementary the week of 10-26-15, with plans to expand to 14 schools. Residential testing will have a different protocol. GCHD has been in contact with DEQ to possibly assist in sampling. Linda Dykema has a draft Executive Summary for Health-Based Drinking Water Lead Levels</p>	<p>No action indicated, informational only – DEQ.</p>	

TASK	STATUS	ACTION	DATE COMPLETED
	<p>developed. Once testing is completed, this document will serve as a decision guide on reopening of school and/or daycare water fountains/faucets for student use. Linda will revise the model to include paint chip values/risk levels. GCHD sanitarians are assisting DEQ with water sampling. We should anticipate some differences in opinion on actionable pb levels.</p> <p>Suggested that the following language that DC used be adapted for our use: "The removal of lead in drinking water is most effective if the full lead service line is removed from both the public and private property. If you choose not to replace your private side pipe, lead can continue to dissolve in your drinking water. You should also replace galvanized plumbing, older lead soldered pipes, and brass fixtures and use a different plumbing material in your home. Until all potential sources of lead in drinking water are removed from your private property, be sure to follow the flushing and filter instructions provided."</p> <p>"Water is lead-free when it leaves the treatment plant, but lead can be released when the water comes in contact with pipes and plumbing fixtures that contain lead. Lead sources and lead levels vary between buildings, so it is important to identify and remove any lead sources in each household."</p> <p>"Pregnant or nursing women and children under age six should use filtered tap water for drinking water and cooking until all lead sources are removed. Filters certified for lead removal are required to meet National Sanitary Foundation (NSF) Standard 53."</p> <p><b><u>This language will be incorporated into EBL investigation reports and in the educational packets the nurses will distribute.</u></b></p>		Pending
Misc.	<p>City of Flint is asking when the county will lift the emergency order. Jim Henry from GCHD mentioned he was hearing some concerns raised again about Legionella. Eden said that Jim Collins can help address this. Mark V. said that an extensive data analysis was done on this previously and it isn't an issue.</p> <p>DEQ gave permission to increase phosphate levels in the water temporarily. Some health concerns might be raised about this particularly for infants. Dr. Eden Wells said that it is unlikely to cause health problems but we can add information on the FAQ to help reassure citizens.</p> <p>DEQ released its Freeman School water testing results this week. EPA released its report from its expedited review of the response as well.</p>		

TASK	STATUS	ACTION	DATE COMPLETED
	<p><b><u>The water testing protocol has been changed to no longer do pre-flushing of the pipes. Other schools that are interested in having their water tested should make a request to DEQ. LARA will do a plumbing assessment before the water samples are taken.</u></b></p> <p>The City of Flint is considering taking over the cost of providing the replacement pipes for at least some of the high risk homes.</p>	FYI only	
	<p>A call was held on the 10<sup>th</sup> with MDHHS staff and the regional USDA staff and congressional staff, on the ready to feed formula issue. Both USDA and Sen. Stabenow's office satisfied with client communication and monitoring process in place. Talking points have been developed by WIC staff and sent to the communication office for review.</p> <p><b><u>The talking points have been approved by the Communications Office. There has only been one client request for Ready to Feed formula in the Flint WIC clinic.</u></b></p> <p><b><u>There will be a farmers market, in conjunction with a flu clinic, that the GCHD is holding on 21 November and lead-related information will be provided by GCHD.</u></b></p>	FYI	<p>Completed</p> <p>Pending</p>
	<b><u>Internal calls will be held once a week on Thursdays at 12:30.</u></b>	FYI

Hi Everyone - Working with Dr. Wells and Sue, Medicaid is planning to send an "L" letter to all Medicaid providers in Flint to help ensure as many providers as possible have, and follow, the enhanced guidelines for lead testing in children. Attached is our draft of the "L" letter -- both Dr. Wells and Sue have signed off too. We are planning on sending this ASAP, but want flag it before it went. Please let me know if you have any thoughts, concerns or comments. Thanks!

Chris

The goal: Assess the extent of the elevated blood lead levels – the number of those affected and the degree to which they're affected

- Get as many people in the affected zip codes tested as possible – can the Red Cross or some other agency with a bus or mobile unit set up for folks to give blood convert over to blood level testing and go into neighborhoods that have low testing rates?

- A public health friend of mine said that Genesee County Health workers are stressed to the max. Can we deploy appropriate personnel from other county health agencies to help with inspecting homes for possible other causes? In other words, it won't do any good to invest more in water infrastructure if we're finding window sills with teeth marks. I say this NOT to downplay the role that water lead levels may have played. But can we get Habitat for Humanity, for example, to do a massive volunteer effort to eradicate lead paint in homes ... or is that beyond their expertise?
- Gather experts to assess exactly how extensive the problem is and potential causes. And then convey this in a much more accessible ways. If you want blood level data, you have to scroll down on the DHHS web site, find the headline and then read a long press release. Maybe we're conveying this information better on the ground, but if not, we need to communicate conclusive findings in multiple ways—graphics, video, informational photo galleries and maybe even a “test” that residents can take to see if their home is at risk in other ways. I know that sounds awfully MLive-ish, but it can be effective.

Team:

Today Harvey and I met with the Flint Water Task Force. It was a good meeting. People were pleased with the G's statement from the prior day. Captain Kelenske joined us and we had a very good discussion about moving forward with the creation of the Flint Water Crisis Agency Coordinating Committee (FIACC). Tim Becker and Captain Kelenske provided me with a fair amount of input. I also read the City of Flint Incident Action Plan for a State of Emergency which Chris received today (enclosed for those who wish to read it as well). I have distilled all of this into a two page plan that I want your edits and comments on and a one page organizational chart (now presented in the “governor's colors” according to our fine people in Communications). Spoiler alert—I made Captain Kelenske Vice Chair of the whole shebang (with the Colonel's blessing) so Harvey wouldn't get lonely.

Here is my ask of you:

- 1) Within 24 (sooner if you can) hours give me your comments and input
- 2) Tomorrow I will turn around a final document for Jarrod to review with the Governor either New Year's Day or Saturday
- 3) Ideally, Governor will approve Harvey sending it to Mayor Weaver Saturday (Sunday latest)
- 4) Mayor needs to know that this is what the Governor wishes to discuss at the meeting January 7 along with financial resources that we still need some estimates on cost from DHHS for
- 5) Meegan and Dave need to noodle how best to get out front with this and change the narrative focus on Monday's Genesee County declaration of emergency

I know we are all working way too hard for what should be a rest and recharge period but I do appreciate everyone's efforts and I know the Boss really does as well.

Regards,

Rich

## A Proposal to Create the Flint Water Inter-Agency Coordinating Committee (FIACC)

In collaboration with the Flint After-Action Task Force, MSP Captain Chris Kelenske, DHHS Chief Deputy Tim Becker and DHHS Director Nick Lyon, Harvey Hollins and Rich Baird are recommending the immediate creation of the above referenced entity, with its sustained role and responsibility enabled under the Governor's Executive Order.

### Statement of Need

Due to a combination of resource constraints, inexperienced personnel, "silo" bureaucratic processes and reactionary approaches to immediate problems, there is a nearly complete lack of coordination, communication, and connected management amongst all the departments and stakeholders who must work together to ensure Flint's return to clean, safe water and to coordinate mid and long term efforts to mitigate and address future health and behavioral consequences from lead ingestion. This group MUST be stood up regardless of whether (or when) the conditions required for a declaration of emergency are met by the City, County, State or Federal authorizers. This coordinating body must include:

- The creation of a routine information process between all parties.
- Pursuit of other avenues of funding including federal grants and legislative appropriations.
- While the Emergency Management Act or the Stafford Disaster Relief and Emergency Assistance Act may be mechanisms to fix the issues in Flint, portions of the Emergency Management Act outlining management of events are applicable and should be implemented without delay (e.g. Local emergency operations plans/emergency operations guides as well as emergency operations support plans).

### Action Plan and Establishing the FIACCC

It appears that a request for a Governor's declaration may be from the county as soon as January 4, 2016. The state's Emergency Coordinator (Capt. Kelenske) will evaluate the request and provide a recommendation whether to issue a declaration, following established protocol and due diligence. But immediately, we will:

1. Establish an interagency workgroup Chaired and Vice-Chaired by Harvey Hollins and Chris Kelenske, respectively, and be comprised of DHHS, MDEQ, MSP, Treasury, Genesee County, City of Flint, MDE, LARA and external Subject Matter Experts (SMEs). Civil Rights may be added at a later time. If additional agencies/stakeholders who can assist with accomplishing the action plan are needed, they will be added. Personnel must be goal oriented, transparent with findings and measures of progress, and able to work toward accomplishing the Incident Action Plan created by the state in a timely manner. A draft Organization Chart is attached under separate cover.
2. This body should be created by Executive Order and it must complement and not replace the current system under the Emergency Management Act. In fact, it should demonstrate how to best leverage support where existing laws fall short under a man-made emergency.
3. Utilize the National Incident Management System and Unified/Incident Command as appropriate.
4. Establish routine communications protocols at the operational, executive, and legislative levels as determined appropriate.
5. Establish interagency workgroup objectives using the following as a starting point.

## Interagency Workgroup Objectives

1. Determine and convey acceptable standards for potable water.
  - Identify needed remediation.
  - Convey the remediation plan objectives to all stakeholders and interested parties.
  - Logistics plan for distribution and serving homebound citizens with water and filtration
  - Implement the plan.
2. Determine health impacts for the impacted population.
  - Identify treatment methods.
  - Nutrition education and support
  - Coping with lead exposure (care, monitoring, neurodevelopmental screening, access to DBP specialists, psychologists/psychiatrists, expanded county services, etc.)
  - Convey the treatment plan objectives to interested parties.
  - Implement the plan.
3. Establish a public information protocol to effectively inform the community of the situation and actions taken.
  - Identify existing Public Information outlets within the city, county, and state.
  - Establish a Joint Information Center
  - Provide for Emergency Alerts and Updates
  - Leverage public and private education schools
  - Determine official information flow and approval of information.
  - Convey to interested parties.
4. Assess the status of the infrastructure and determine feasible actions to upgrade the water system.
  - Determine current state of the infrastructure.
  - Develop priorities, costs, and potential funding sources for infrastructure upgrades as part of a long term recovery plan.
  - Seek partners to assist (NGOs, Foundations, Business, etc.)
  - Implement the plan.

## Final Thoughts

After the team provides input to this document, I would ask that Governor Snyder review and approve the approach, authorize Harvey Hollins to get the plan to Mayor Weaver no later than this weekend, and then proactively communicate the plan regardless of whether we get an Emergency declaration or not.

Also, we do believe setting up an Emergency Command Center which requires 24/7 staffing is sensible until AFTER Genesee County has demonstrated they did all they could and couldn't solve the problem. That is what is required under the law.

**CITY OF FLINT**  
**INCIDENT ACTION PLAN**  
**STATE OF EMERGENCY**

# CITY OF FLINT

DR. KAREN WEAVER  
MAYOR

NATASHA C. HENDERSON  
CITY ADMINISTRATOR

## **Objectives:**

To provide short term relief and long term solutions in addressing the man-made emergency of increased lead levels in the City of Flint (the "City") water system resulting from the switch to Flint River as the City's water source as well as the threat to public health related to elevated blood lead levels in Flint residents, without interruption of the provision of public safety and other essential public services. Due to the fluidic nature of emergencies and the complexity of the City of Flint's declared emergency, this plan serves as a framework and may be altered as the emergency develops.

## **The Response Framework**

The purpose of this plan is to organize efforts on behalf of the city to assess the extent of the City's infrastructure needs and risks to public health, provide immediate relief to those who are at risk, and establish long term solutions. In addition, the city must ascertain what immediate relief and long term solutions the City is capable of implementing based on what resources are available. For any activities that are beyond the resource capacity of the City, external sources of funding, supplies, and manpower must be sought.

There are a number of steps that must be taken in accordance with the Flint Emergency Support Operations Plan (SEOP), in order for the City to be compliant with the Genesee County Emergency Action Guidelines. These include the activation of the Incident Management Team, the Emergency Operation Center, and the sharing of essential documents with the County, including this plan. Information must also be shared by the City's Public Information Officer on a regular basis, as required by the SEOP.

This plan calls for the provision of immediate relief to those at risk in our community. Special consideration must be given to residents who belong to underserved groups, such as those who are homebound, undocumented, in poverty, etc. Additional consideration must also be given to the equitable provision of services throughout our community in order to equally protect the health and safety of every member of our community.

Implementation of this plan is to be conducted by the Incident Management Team, which will monitor the effective delivery of goods and services in order to address the conditions of the emergency.

## **Understanding the Issue:**

October 1, 2015, the Genesee County Health Department issued a Public Health Emergency after elevated blood-lead levels were found among children in the City of Flint. This incident correlates with elevated levels of lead found in the City's drinking water after the City switched water sources in April of

# CITY OF FLINT

DR. KAREN WEAVER  
MAYOR

NATASHA C. HENDERSON  
CITY ADMINISTRATOR

2014 to the Flint River. The scope of this problem appears to be limited to Flint City Water Customers and their dependents. Public agencies from several levels of government, as well as charitable, nonprofit organizations have partnered with the City to provide immediate relief to Flint residents, including the expansion of health services, the provision of bottled water and NSF rated water filters. The city is also seeking long term infrastructure improvements to eliminate lead and other contaminants from the water system.

Gov. Rick Snyder appointed a task force to review "actions regarding water use and testing in Flint" and to make recommendations for future guidelines: Members of the state task force are Ken Sikkema of Public Sector Consultants, Chris Kolb of the Michigan Environmental Council, Dr. Matthew Davis of the University of Michigan Health System, Eric Rothstein of the Galardi Rothstein Group and Dr. Lawrence Reynolds of Mott Children's Health Center.

In an effort to halt the further escalation of this crisis, the City returned to receiving its water from the Detroit Water and Sewerage Department (DWSD) on October 16, 2015. Since that time, additional corrosion control program has started, estimating a reduction of lead levels over the next six months. In light of these efforts, concerns surrounding the quality of water and health of the residents persist to the point that Mayor Karen Weaver declared a State of Emergency on December 14, 2015 so as to resolve this crisis once and for all.

The current challenge facing the City is providing immediate relief and long term solutions of the quality of the water and health of residents while the City remains in a financially critical condition. It is hoped and expected that higher levels of government recognize this emergency as it pertains to the condition of the City's infrastructure and health of its residents, and do all things necessary to assist the City in the provision of relief and the execution of capital improvement projects that will eliminate the causes of this emergency.

## Enhancing Understanding:

### Information Collection

Essential Elements of Information (EEl)s can be qualified as the City's water tests containing lead results, the verification of lead water lines (both public and private), and health information. Water testing is performed by the City's water plant in cooperation with the MDEQ. The verification of lead water lines is being handled by University of Michigan Flint, who is currently digitizing the City's water line information and PSI Engineering, who is initiating the effort to verify lead lines by excavating an initial 150 residential lines. This information allows the Incident Management Team to assess the current condition of the emergency by way of determining the water quality and the condition of the water distribution infrastructure.

## **Information Analysis**

The City has sought partners to assist in the analysis and attenuation of complex data. Wayne State University's center for Urban Studies has agreed to assist the City in its efforts to document and track lead water lines, water test results, and filter distribution with geographic information system (GIS) technology. This allows for easily updateable, digestible information to be presented to officials.

## **Assessment of Impacts**

The City will need assistance in determining the total cost of damage done to the public health and infrastructure. As of now, only portions of this damage are visible.

PSI is providing some assistance by excavating 150 residential water lines to verify that they are comprised of lead. This is an initial step, but not enough. More resources will be needed to continue this process.

## **Continuous Situational Awareness**

It is important that the Emergency Management Team receive continuous information regarding water testing results, lead water line numbers, and filter distribution information in order to gain a realistic and current perspective. Much of this information is currently available on the City's website (cityofflint.com) and more is added each week by the PIO team.

## **Actions taken in Response to the Emergency**

### **Activation of the Incident Management Team**

Upon the declaration of Emergency by Mayor Weaver, the Support Emergency Operations Plan (SEOP) was activated. The SEOP calls upon the Incident Management Team to generate the Incident Action Plan (IAP). Each member of this team serves a specific function as it relates to addressing the causes and effects of the emergency. The Emergency Management Team roster can be found in the SEOP on page 3, with a list of alternates on page 4 in case the need for succession arises.

### **Emergency Operations Center**

The Emergency Operations Center (EOC) must be activated upon the declaration of a State of Emergency by the Mayor. This center is required by the SEOP and serves as a nerve center for the Incident Management Team. Here, emergency relief efforts are coordinated by key members of the Incident Management Team. In this case, these relief efforts consist of the distribution of water filters at

# CITY OF FLINT

DR. KAREN WEAVER  
MAYOR

NATASHA C. HENDERSON  
CITY ADMINISTRATOR

City Hall and community events, the distribution of bottled water throughout the city in conjunction with the efforts of community partners, and assisting with the circulation of water testing kits throughout the community. The EOC will also be monitoring and managing the inventory of relief supplies, such as water filters and bottled water.

According to the SEOP, the EOC must establish an incident tracking system. This system will serve as a work plan for the management of the emergency. In addition, it is essential that the IMT record water testing results, lead water line location information, and information about the distribution of water filters and bottled water all in one place so that information is readily available for the Incident Management Team. This information will also be sent out to the public and media in the form of daily regular updates by the City's PIO.

## Communication

The EOC maintains a telephone system that exists to intake questions about relief efforts and to organize relief logistics. It is open from 8am to 5pm, Monday through Friday. A voicemail system and eventual email system will exist to handle requests and inquiries that occur outside of the normal operating hours. This system will be constructed by the City's IS department.

## Public Awareness and Education

### 1. Emergency Alerts and Updates:

The City's Public Information Officer will make available information as it relates to the emergency in the form of press releases, emails, and physical documents. Daily updates containing information on the distribution of water filters, bottled water, water testing, blood lead testing, and other relief efforts will be available on the City's website for the public to view. Information will be available at City Hall for residents.

### 2. Joint Information Center:

The City's PIO will establish a joint Information Center that is organized to coordinate the efforts of multiple agencies to communicate with the public. This includes the circulation of joint press releases, public health information, educational materials, and updates relating to the State of Emergency. This committee is comprised of public information officers and public relations personnel to coordinate efforts to keep the public updated and informed. Regular updates to the media regarding events and progress will be made as news develops.

The US EPA has offered assistance in the form of Public Information support. Additional support in this area has been provided by the Michigan State Police.

### 3. Education:

Many government agencies and philanthropic organizations are already distributing information regarding the effects of lead on public health. It is important that the City assist in these efforts so vital information and knowledge is presented to all members of the community. The goal is to continue to eliminate misunderstandings and incorrect information as it relates to reducing lead in drinking water, pursuing medical help, and maintaining a healthy diet to reduce lead absorption in the body. Lead education is currently being performed by the Genesee County Health Department, the Michigan Department of Health and Human Services and Medical community at-large.

### Assessment of Social Needs

In order to effectively and equitably provide immediate relief to Flint water customers, the City must take into account many of the socio-economic needs and limitations of the community. Some residents cannot get to City Hall for a water filter. Some residents do not have internet access. Literacy or a language barrier may also pose significant obstacles to the effective distribution of educational information and relief to those in need. These will be continuing challenges facing the community. At present these are the resources the City has available to mitigate some of those challenges.

### Logistics

Logistics are being coordinated by the City Emergency Management Team's City's *Chief Logistics Officer*, who is the City Administrator. The CLO is responsible for the coordination, procurement, and transportation of goods and services, which is essential for effective implementation of the response plan.

### Fixed Distribution Points

There are several locations throughout the city where residents may acquire a water filter. These locations are:

***Flint City Hall***

*1101 South Saginaw, Flint MI 48502*

***Genesee County Community Action Resource Department (GCCARD)***

*601 North Saginaw, Flint MI 48502*

*and*

*2727 Lippencott Blvd, Flint MI 48507*

# CITY OF FLINT

DR. KAREN WEAVER  
MAYOR

NATASHA C. HENDERSON  
CITY ADMINISTRATOR

## **Michigan Department of Health and Human Services**

4809 Clio Road, Flint MI 48504

and

125 E. Union Street, Flint, MI 48502

### **Activation of Ward Distribution Centers**

Each of the nine wards will have activated distribution centers that are primarily managed by City Council Members or their designees.

#### **Flint City Council – Water Distribution Sites**

WARD	COUNCILPERSON	LOCATION	ADDRESS
1	Eric Mays	Hasselbring Senior Center	1002 W. Home Avenue
2	Jackie Poplar	Joy Tabernacle Church	2505 N. Chevrolet Avenue
3	Kerry Nelson	Antioch Baptist Church	1083 E. Stewart Avenue
4	Joshua Freeman	Flint Fire Station No. 5	3402 Western Road
5	Wantwaz Davis	Doyle/Ryder Elementary School	1040 N. Saginaw Street
6	Herbert Winfrey	New Community Baptist Church	1375 Lavender Avenue
7	Monica Galloway	Brennan Community Center	1301 Pingree Avenue
8	Vicki VanBuren	Flint Southwestern Academy	1420 W. 12 <sup>th</sup> Street
9	Scott Kincaid	Dort Mall Police Service Station	3600 S. Dort Highway

### **Mobile Distribution Centers**

With the help of transportation agencies, like the Metro Transit Authority (MTA), meals on wheels, and GCCARD, the city can help establish mobile distribution centers and delivery systems that can provide water filters, bottled water, and nutritious foods, among other types of relief accompanied by educational materials to neighborhoods and to homes of people who experience limited mobility.

- Mass Transportation Authority-MTA bus passes: Assisting residents with bus passes to improve their mobility will increase their chances of receiving help. Transportation services will also improve residents' access to medical care.
- MTA-Your Ride mobile distribution:
  - Estimated Costs: \$25 per hour to deliver water and filters to homes throughout the City.

### **Problem 1. Public Health Emergency**

The first objective in addressing this emergency is reducing, and eventually eliminating, the danger to public health. As City water coming out of faucets continue to contain lead, and copper and other

harmful contaminants exceeding government guidelines and regulations, it poses a risk to the people of our community. Preventative measures must be taken to avoid the effects of toxicosis that are difficult if not impossible to completely reverse.

As far as preventative measures are concerned, education, water filters, and bottled water must be provided to every household in the City in order to reduce the chances of lead exposure, especially to our most vulnerable members of the community. If lead exposure has occurred, resulting in elevated blood lead levels, immediate and sustained medical attention must be available to those affected. Health services must be expanded in the area to accommodate increased numbers of case loads and specialized care regarding lead poisoning and its effects.

### **Immediate Relief for Public Health:**

1. Prevention: Education, water filters and replacement cartridges, free water testing, and bottled water must be available to everyone.
2. Access to nutritious food that reduces the risks of lead absorption by the body. The City can coordinate activities with the County Health Department

### **Long Term Solutions: Maintaining Public Health and Coping with Lead Exposure**

1. Work closely with the Genesee County Health Department and Michigan Department of Health and Human Services in order to provide sustainable care and monitoring of children exposed to lead. This care must be available for them for several years-preferably several decades.
2. Support and education for primary care providers regarding aggressive long-term neurodevelopmental screening and testing.
3. Improved access to developmental and behavioral (DBP) specialists, pediatric psychologists, pediatric psychiatrists.
  - a. Pre-emptive referral to mental health/ toxic stress screenings.
  - b. Support capacity building and or incentivize recruitment to allow Genesee health system (CMH) to build this capacity which is currently needed and lacking.
4. Increase recognition and education regarding trauma informed care, social determinants of health (SDOH).
5. Expand State funded Genesee Health System (CMH) services.
  - a. Infant mental health (30 day capacity)
  - b. Child case management
  - c. Home based services
  - d. Trauma informed care- trauma focused CBT

## **Problem 2. Lead Contamination in the Water**

### **Immediate Relief:**

# CITY OF FLINT

DR. KAREN WEAVER  
MAYOR

NATASHA L. HENDERSON  
CITY ADMINISTRATOR

1. Education, water filters and replacement cartridges, free water testing for water customers, and bottled water must be available to everyone. Water filters can be obtained at any of the fixed distribution points throughout the City.
2. Identification and verification of lead water service lines throughout the city- both public and private.
3. Assistance to identify lead pipes within buildings and homes.

## **Distribution of Bottled Water:**

At this point, we are directing all offers for donations to the Food Bank of Eastern Michigan. It is imperative that water be accessible to all members of the community through a variety of distribution channels. These channels are explained in the Logistics Section of this plan.

## **Distribution of Test Bottles:**

Water testing kits can be picked up at City Hall with instructions. Test results are posted on the City's website to raise public awareness and encourage more participation.

## **Long term Solutions: Capital Improvements Needs**

The distribution of filters, water, and food to counter the effects of lead are essential response efforts to keep people safe. However, long term solutions are required to keep people healthy, to eliminate lead from the public and private water distribution system distribution, and to provide affordable clean water. Our public infrastructure and utilities must be reliable, sustainable, and equitable in order for this community to rebound after this emergency. The following long term solutions must be implemented in order to set the City of Flint on a course for recovery. These solutions come at a heavy cost for a City that is currently in receivership. The City has experienced financial distress due to this Emergency, in addition to a two million dollar loss from switching back to DWSD. The City has diligently applied for Fiscally Distressed Cities, Villages, and Townships, Grant in order to supplement funding for capital improvement projects. It is essential that these grants be awarded in order to achieve long term solutions.

### **1. COMPLETE Transition to a Temporary Safe Water Source until the Completion of KWA:**

This has already occurred. On October 16, 2015, Flint returned to receiving its water from DWSD on a 9 month agreement. This agreement will expire in June 2016, when the KWA is projected to be complete. The City had to pay \$2 million out of its general fund to make this switch.

### **2. IN PROGRESS Additional Corrosion Control added to the Water System:**

# CITY OF FLINT

DR. KAREN WEAVER  
MAYOR

NATASHA L. HENDERSON  
CITY ADMINISTRATOR

This is already occurring. In early December, 2015, Flint began to add additional corrosion control to the water coming in from DWSD in attempts to rebuild the protective scale inside its pipes. This is estimated to reduce lead levels in two to six months.

### 3. **Faucet Replacement:**

Replacement of Water faucets, and drinking fountains in the school system. It has been determined after state inspections that many sources of lead contamination in the School System's water were the faucets themselves. These faucets need to be replaced.

### 4. **Water Line Replacement:**

Water Line Replacement to reduce antiquated infrastructure and lead service lines. These lines must be identified, verified, and replaced. Residents who are facing financial hardships must have access to assistance to cover the costs of these replacements through access to grants and (forgivable) loans made available through State and Federal agencies. The corrosion damage to public and private lines that Flint River water caused is still being determined.

- Replacement of an estimated fifteen thousand (15,000) lead service lines at an estimated cost of three thousand dollars (\$3,000) per line. Total costs forty –five million dollars (\$45,000,000). This project is estimated to be one of the most cost-intensive endeavors related to ameliorating water contaminants.

### 5. **Reimbursement of Critical Expenditures:**

Seeking reimbursement of two million dollar cost of returning to DWSD and forgiveness of Water Revolving Loan Debt from the State of Michigan.

6. **KWA Capital Improvements:** The City has reconnected to Detroit temporarily until a water line from Port Huron is developed. The new water line known as the KWA pipeline or Karegnondi Water Authority is expected to bring water to the City from Lake Huron by July. The current cost agreement between Flint and DWSD is for nine months, therefore it is imperative that KWA be completed as soon as possible. Assistance relating to capital improvements to expedite this process will help to achieve long term goals.

#### **KWA Capital Improvements:**

#### **Estimated Costs:**

a. <i>Transfer Station to Dort Reservoir</i>	<i>\$4,500,000</i>
b. <i>Raw water line to pump station #4</i>	<i>\$636,000</i>
c. <i>Phosphoric acid feed system</i>	<i>\$186,000</i>
d. <i>Alum Feed system</i>	<i>\$40,000</i>
e. <i>Post filtration system</i>	<i>\$387,289</i>

# CITY OF FLINT

DR. KAREN WEAVER  
MAYOR

NATASHA C. HENDERSON  
CITY ADMINISTRATOR

f. SCADA Upgrades	\$424,000
g. Sewer Relining	\$100,000
<b>Total</b>	<b>\$6,273,289</b>

## Ancillary Considerations: Public Safety during an Emergency

During a time of emergency public safety agencies need to be prepared to respond to threats to public safety and critical infrastructure. The City is facing a man-made emergency that is threatening the public health. Resentment and hostility toward local institutions and municipal government is at a significant level.

Critical infrastructure should be safeguarded if the need arises. This includes increasing security at City Hall to reduce potential for public safety risks. In the case of credible threats to public infrastructure, it may be required to hire private security company for first line of defense. Private Security is lower cost, thereby making it the first option. The minimum response is acted upon first, elevating only if the need arises. Credible or imminent threats of damage or destruction to critical infrastructure requires an elevated response. Such needs may require over-time police officers to address critical situations. Mutual aid from surrounding communities can be requested if Flint public safety is overextended.

## Implementation:

### Community Partners

Financial limitations of the city persist while it confronts this emergency. Many community partners have offered their assistance to perform various needed functions. The city is heavily reliant on the assistance that government agencies and nonprofit organizations have provided.

#### The Mott Foundation

The Mott Foundation has provided financial assistance, especially in their generous contribution of \$4 million. In addition, the Mott Foundation has recently pledged an additional

#### United Way

The Genesee County United Way has provided significant financial assistance in the way of purchasing and helping to distribute water filters since the public health emergency began on October 1<sup>st</sup>, 2015.

#### Genesee County Community Action Resources Department (GCCARD)

# CITY OF FLINT

DR. KAREN WEAVER  
MAYOR

NATASHA C. HENDERSON  
CITY ADMINISTRATOR

GCCARD is organized to fight poverty and has been a primary partner in the distribution of water filters. It has also regularly supported the city with the logistics and availability of water filters at City Hall.

## **Genesee County Health Department**

Has provided educational information to Flint Water customers

## **Genesee County Board of Commissioners**

The Board of Commissioners have pledged their support to help Flint seek solutions to this crisis. The Board has already assisted in making health and nutrition information available to the public.

## **Assistance from Wayne State University**

Wayne State University's Center for Urban Studies will be providing technical GIS support to assist in the documentation of emergency relief efforts.

## **The US Environmental Protection Agency**

Region 5 EPA has offered assistance with Public Information distribution during the emergency.

## **Outside Help is still needed...**

The City of Flint is forever thankful to our community partners who have given so much to help so many people. However the magnitude of this emergency calls for more resources that are beyond the capacity of the combined local organizations and government agencies. Long term solutions will require a heavy investment in health care and capital improvement projects to upgrade the city's antiquated water distribution system.

- Help with Immediate Relief in terms of assuring allocative efficiency. Distribution should be equitable- assistance from other governments required to assure this.
- Reaching communities for the distribution of water filters, water, and educational materials.
- Help with Water Testing to increase participation and lead education.
- Increasing the rate of water testing
- Assistance is required to fund essential capital improvement projects to guarantee clean and safe water.

Sorry for the delay – I've literally been on the phone for the last two hours. Could we please add that we need to have a public health campaign or effort so if we could assist local efforts at educating citizens about perceived an actual risks to lead exposure and what to do to reduce those risks. Thanks.

Dear Governor,

Below are our 26 action steps we are working on:

## **26 Action Steps for Next Week, October 12-16, 2015**

1. Identify schools and prioritize for assessment
2. Get DLARA plumbers organized
3. Complete sampling instructions
4. MDARD info for restaurants
5. Update 2004 letter to EPA
6. Approve Flint plan for water line
7. Lead education plan for schools for Drinking Water
8. Begin regular meetings with Flint
9. Schedule WTP tour
10. Meet with schools and DLARA-invitation only
11. Update Web page
12. Contact DHHS to see where they are with United Way
13. Circulate protocol draft with EPA
14. Contact City about homeowner sample delivery
15. Communicate to MDARD and City that business samples should be coordinated through lab
16. Figure out number of samples from schools and child care facilities
17. Confirm Lynda Dykema is POC for DHHS
18. Contact KWA to find out if there are any bottlenecks we need to remove
19. Expedite 399 Plan and Phosphate Plan
20. Get update on service line index card conversion and identify where partial replacements exist
21. Make sure DHHS gets info so they can cross reference
22. Legislative contacts
23. Legislative time line and summary
24. Dan reconnect with state superintendent
25. Conduct After Action Plan
26. Change Part 54-Drinking Water Revolving Loan Fund

If you have any questions, please let me know.

Dan Wyant  
Director

Honorable Rick Snyder, Governor  
State of Michigan

Dear Gov. Snyder,

I'm writing to voice my displeasure with the lack of communication between your office and mine concerning the water crisis in the city of Flint.

Since I have been in a position to represent my community at the Capitol, I have been in constant contact with your office to offer advice, help, partnership and solutions. My community elected me to represent them in Lansing, and I have been striving to do just that. Several letters have reached your office, and I have been highly vocal about the need to come together to fix the water crisis. This has been done with the understanding that we both care about the people of Flint, who I represent in the Legislature, and who you represent as governor of this state.

I have also reached out to Dr. Eden Wells and the Department of Health and Human Services and the Michigan Department of Environmental Quality to be proactive in addressing the issue of lead-laced water damaging the minds and bodies of Flint's citizens, especially the children. While this crisis could be solved by switching water sources, the problems will remain in the health of our future generation.

I had hoped that this entire problem would have been addressed through partnership, teamwork and cooperation. It is unfortunate that hasn't been the case. It is also unfortunate that common courtesy to my office on being kept up to speed with any operational changes and financial solutions has not been timely communicated.

I will continue to keep the lines of communication open as we address the continued problem of health in Flint, and I hope you will take the opportunity to join me in conversation to find future solutions.

For the Love of the Community,

Sheldon A. Neeley, State Representative  
34<sup>th</sup> District

CC: Dennis Muchmore  
Nick Lyons  
Dan Wyant  
Dr. Eden Wells  
Harvey Hollins

RICK SNYDER  
GOVERNOR

STATE OF MICHIGAN  
DEPARTMENT OF HEALTH AND HUMAN SERVICES  
LANSING

NICK LYON  
DIRECTOR

October 12, 2015

The Honorable Sheldon A. Neeley  
Michigan House of Representatives  
P.O. Box 30014  
Lansing, MI 48909

Dear Representative Neeley:

Thank you for your concerns, and your request for information last week.

Currently, all children in Flint on Medicaid will be covered for lead testing. Further, any physician can order a lead test and this test should be covered by all health insurance programs. Any Flint child not on Medicaid, WIC, or health insurance can get a blood lead level drawn at the Genesee County Health Department.

We are coordinating with and supporting the lead role of the Genesee County Health Department (GCHD) and its Health Officer, Mark Valacak, and his staff to prioritize lead testing of Flint children. The first action is to follow-up and test any child who has had an elevated blood lead level over 5 mcg/dl since April 2014; then, any child within the three schools identified as having lead levels elevated in their water system, then all other Flint children, with younger ages prioritized before older ages.

GCHD is coordinating these actions via their partnerships with health plans, provider clinics, Genesee County Medical Society, and the Greater Flint Health Coalition. We are in daily communications with GCHD and are assisting with planning and response at all levels.

Sincerely,

A handwritten signature in cursive script, reading "Eden Wells".

Eden Wells, MPH, FACPM  
Chief Medical Executive  
Michigan Department of Health and Human Services

**Subject:** PPTs on LPP

Hey there,

I have to put together a ppt presentation for Rashmi on early childhood prevention programs including LPP.

Do you have any slides that talk about your work? Specifically, I am looking for ones that answer the question:

1. What is the LPP program?
2. What does it do?
3. How does it do this?
4. What outcomes is it achieving?

I think Nancy may have created something like this for Sue Moran...if so, just send that along.

Thanks,  
Em

# Current Context

## CDC Response to Advisory Committee on Childhood Lead Poisoning Prevention: Recommendations in “Low Level Lead Exposure Harms Children: A Renewed Call of Primary Prevention.” May 2012

- Eliminates term “level of concern” of 10  $\mu\text{g}/\text{dL}$  , moves to a **reference value** that is based on 97.5 percentile of the BLL distribution of children aged 1-5 in USA, currently at 5  $\mu\text{g}/\text{dL}$ .
- Emphasizes **preventing lead exposure** rather than responding after exposure has taken place.

[http://www.cdc.gov/nceh/lead/ACCLPP/CDC\\_Response\\_Lead\\_Exposure\\_Recs.pdf](http://www.cdc.gov/nceh/lead/ACCLPP/CDC_Response_Lead_Exposure_Recs.pdf)

# Current Context, cont.

AAP Pediatric Environmental Health Specialty Unit (PEHSU): Recommendations on Medical Management of Childhood Lead Exposure and Poisoning. June 2013

- Updates AAP recommendations to match 2012 CDC guidance.
- Incorporates for the first time recommendations for medical management of lead levels below 10  $\mu\text{g}/\text{dL}$  , including anticipatory guidance by primary care provider.

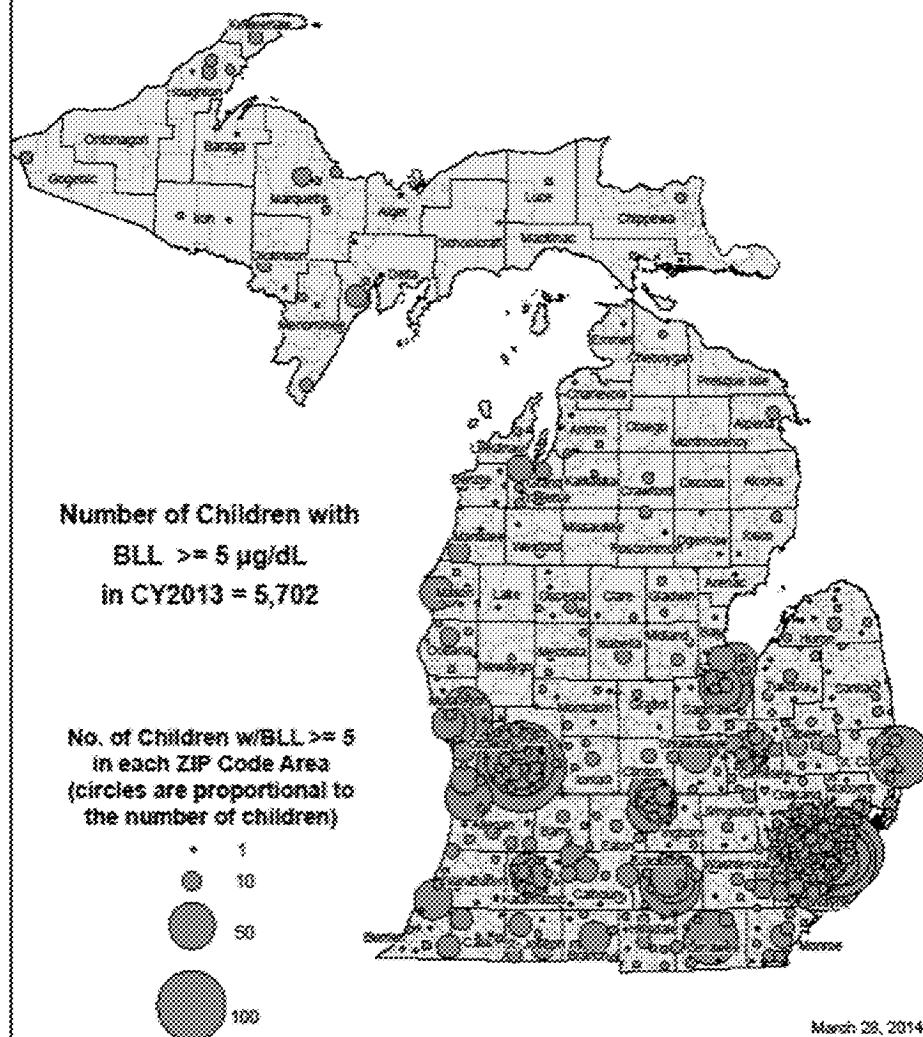

# Current Context, cont.

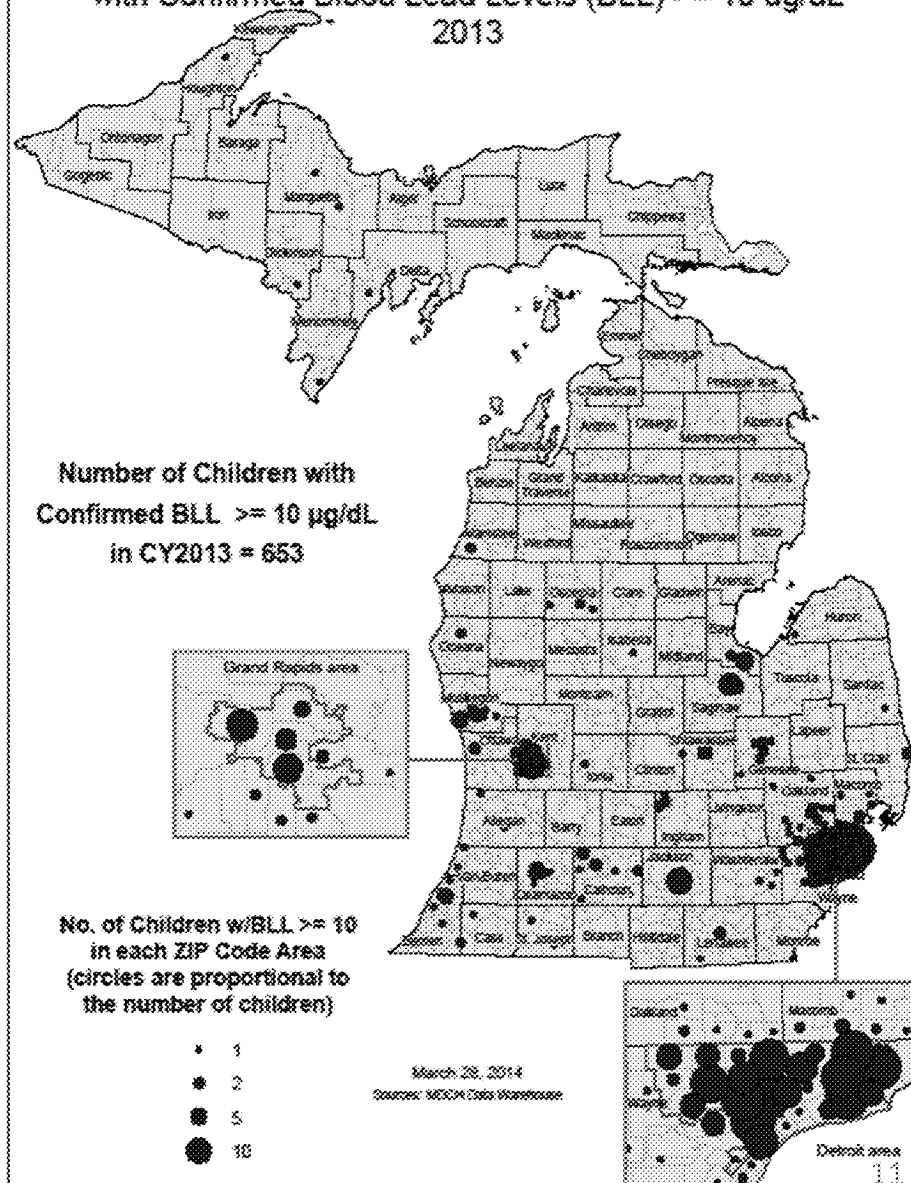

- Medical Services Administration is incorporating updated AAP Recommendations into new EPSDT chapter of the Medicaid Provider Manual, Summer/Fall 2014.
- CLPPP is in the process of updating Program Provider Guidelines and other program documents.

# Current Status

Children less than Six years of Age  
with Blood Lead Levels (BLL)  $\geq 5$   $\mu\text{g}/\text{dL}$   
2013

Children less than Six years of age  
with Confirmed Blood Lead Levels (BLL)  $\geq 10$   $\mu\text{g}/\text{dL}$   
2013

# Current Status

Children with Confirmed Blood Lead Levels  $\geq 10$  ug/dL in 2013,  
by Local Health Department Jurisdiction

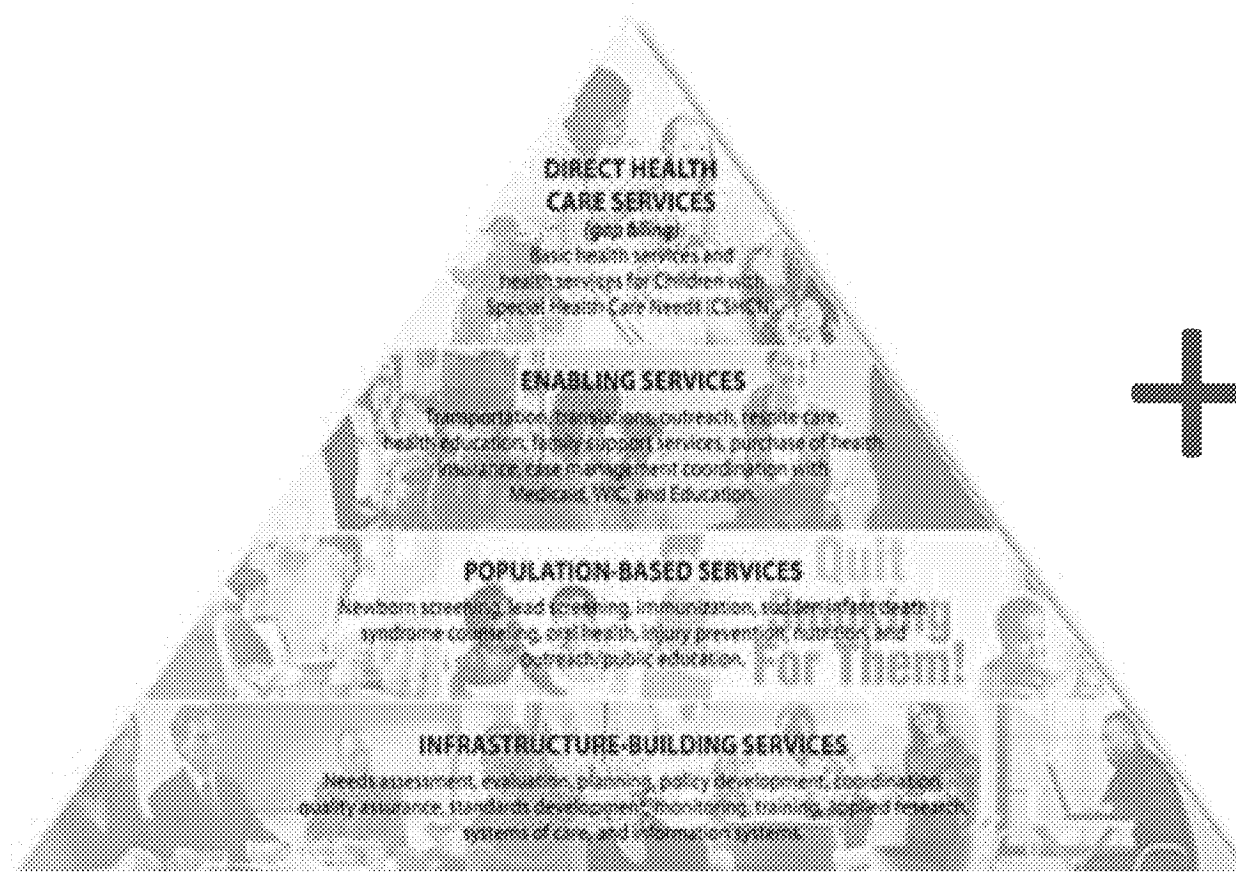

# CLPPP Activities - 2013

- Worked with stakeholders to begin a CQI process; 2 primary issues identified:
  - Education for Providers
  - Issues with Medicaid billing
- Worked with Public Sector Consultants and stakeholders to develop an Education & Outreach Plan in 2013.

# How we organize our work

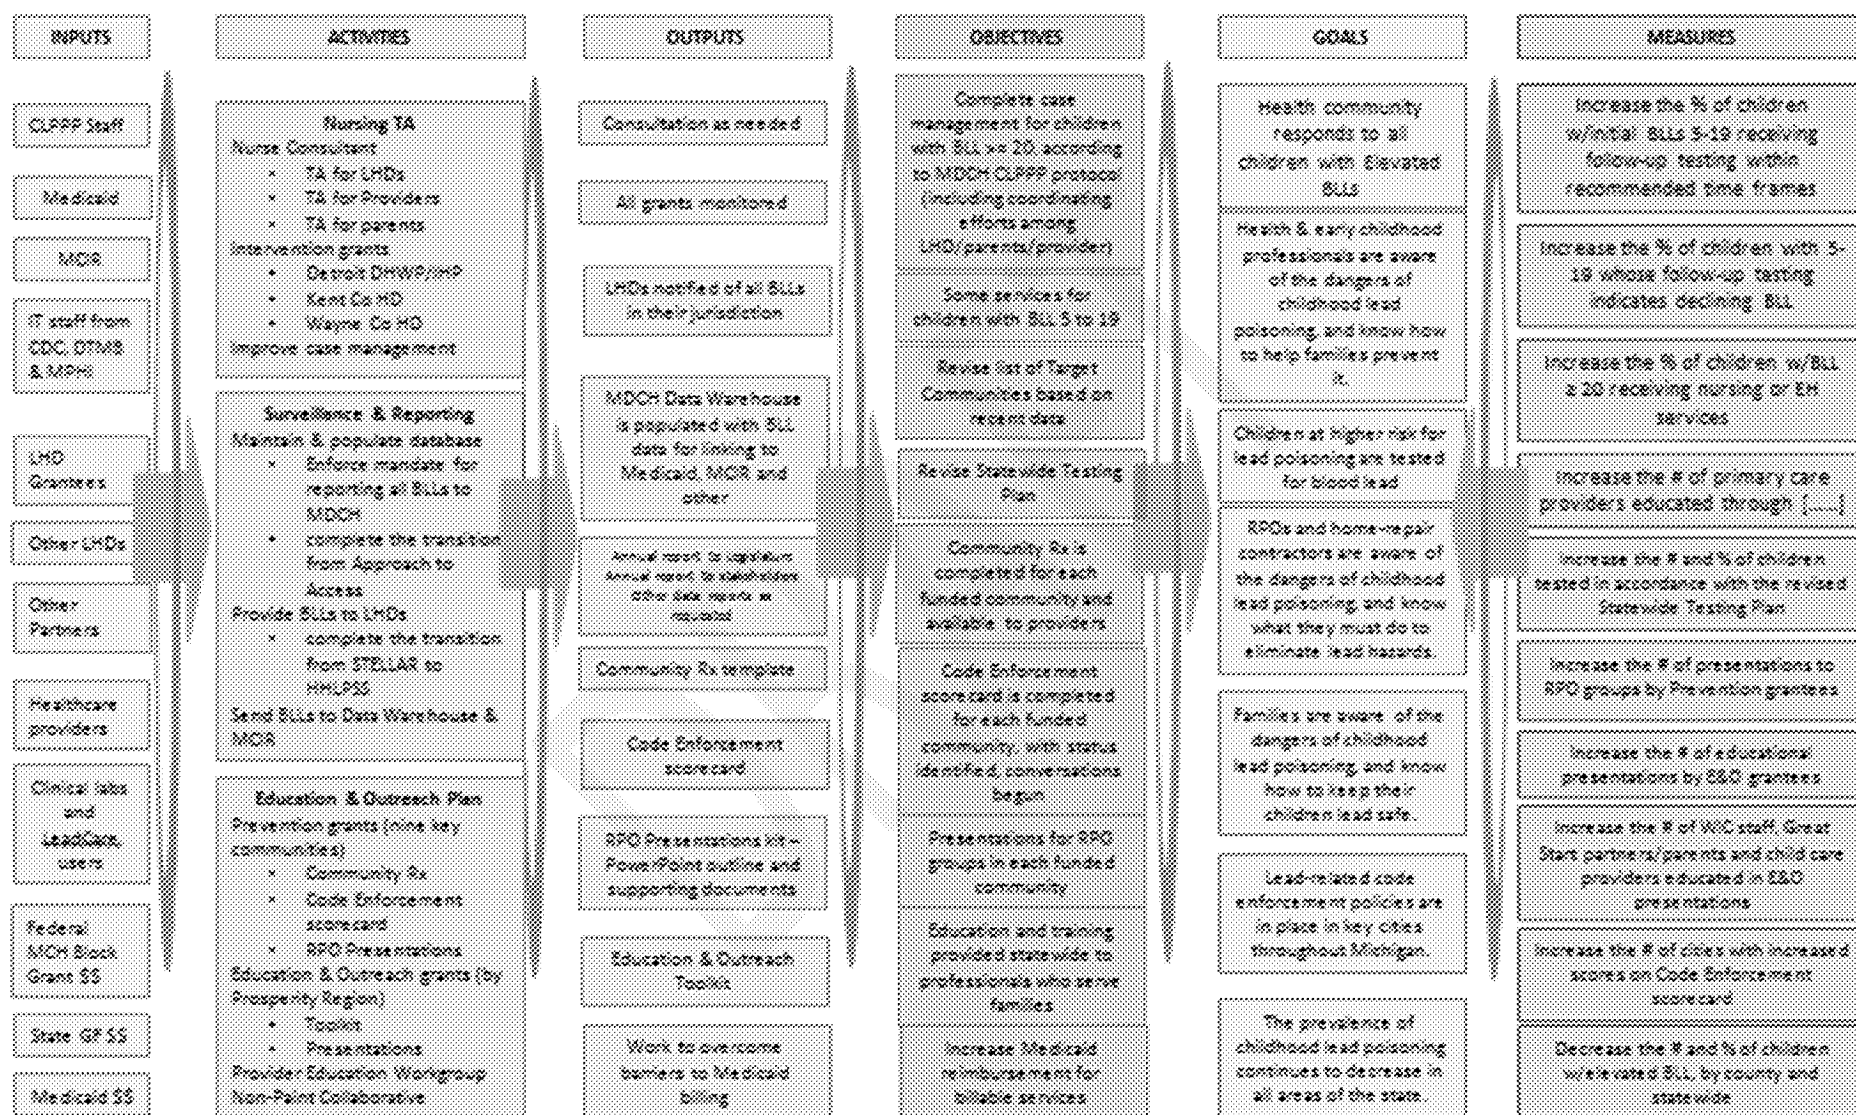

+

## Michigan Public Health Code

PA 368 of 1978  
Section 333.5474

# CLPPP Logic Model

4/11/2014

# CLPPP Activities - 2014

- Convening a Provider Work Group with Matt Davis; includes Physicians and Medicaid Health Plans.
- Working with MDCH Communications Office to develop a new CLPPP Tool Kit, targeting “health care providers, child care providers, public schools, owners and tenants of residential dwellings, and parents of young children” (from PH Code).
- Working with Deb Brinson regarding funding issues.
- Actively working on 9 of 12 highest priority recommendations from the Education & Outreach Plan.

# CLPPP Activities - 2014

Based on Education & Outreach Plan – using additional MCH Block grant funds:

- Released RFP and contracts for Education & Outreach grants in 9 of 10 Prosperity Regions (*no applications from Region 6. \$230,000 total*).
- Released Prevention funding for 9 communities with highest number of cases of 5 µg/dL (*Detroit, Flint, Grand Rapids, Hamtramck/Highland Park, Jackson, Lansing, Muskegon, Saginaw; Kalamazoo refused funds. \$177,500 total*).
- Released Intervention funding to 3 communities with highest number of cases of 10 µg/dL (*Detroit, Grand Rapids, Hamtramck/Highland Park. \$265,000 total*).

# Challenges/Implications

- Current funding and infrastructure for **INTERVENTION** in lead cases is not working.
  - More Health Departments are choosing not to participate with CLPPP; not a mandated service (e.g. recent case in Kalamazoo).
    - Health Departments cite low Medicaid reimbursement rates.
    - CLPPP study shows that current reimbursement does not cover costs.
    - Medicaid data shows low billing rates by Health Departments, so hard to justify increases.
  - Fewer Health Departments are conducting needed Environmental Investigations.
  - Health Departments that do provide lead-related services need additional staff training and \$\$ support.

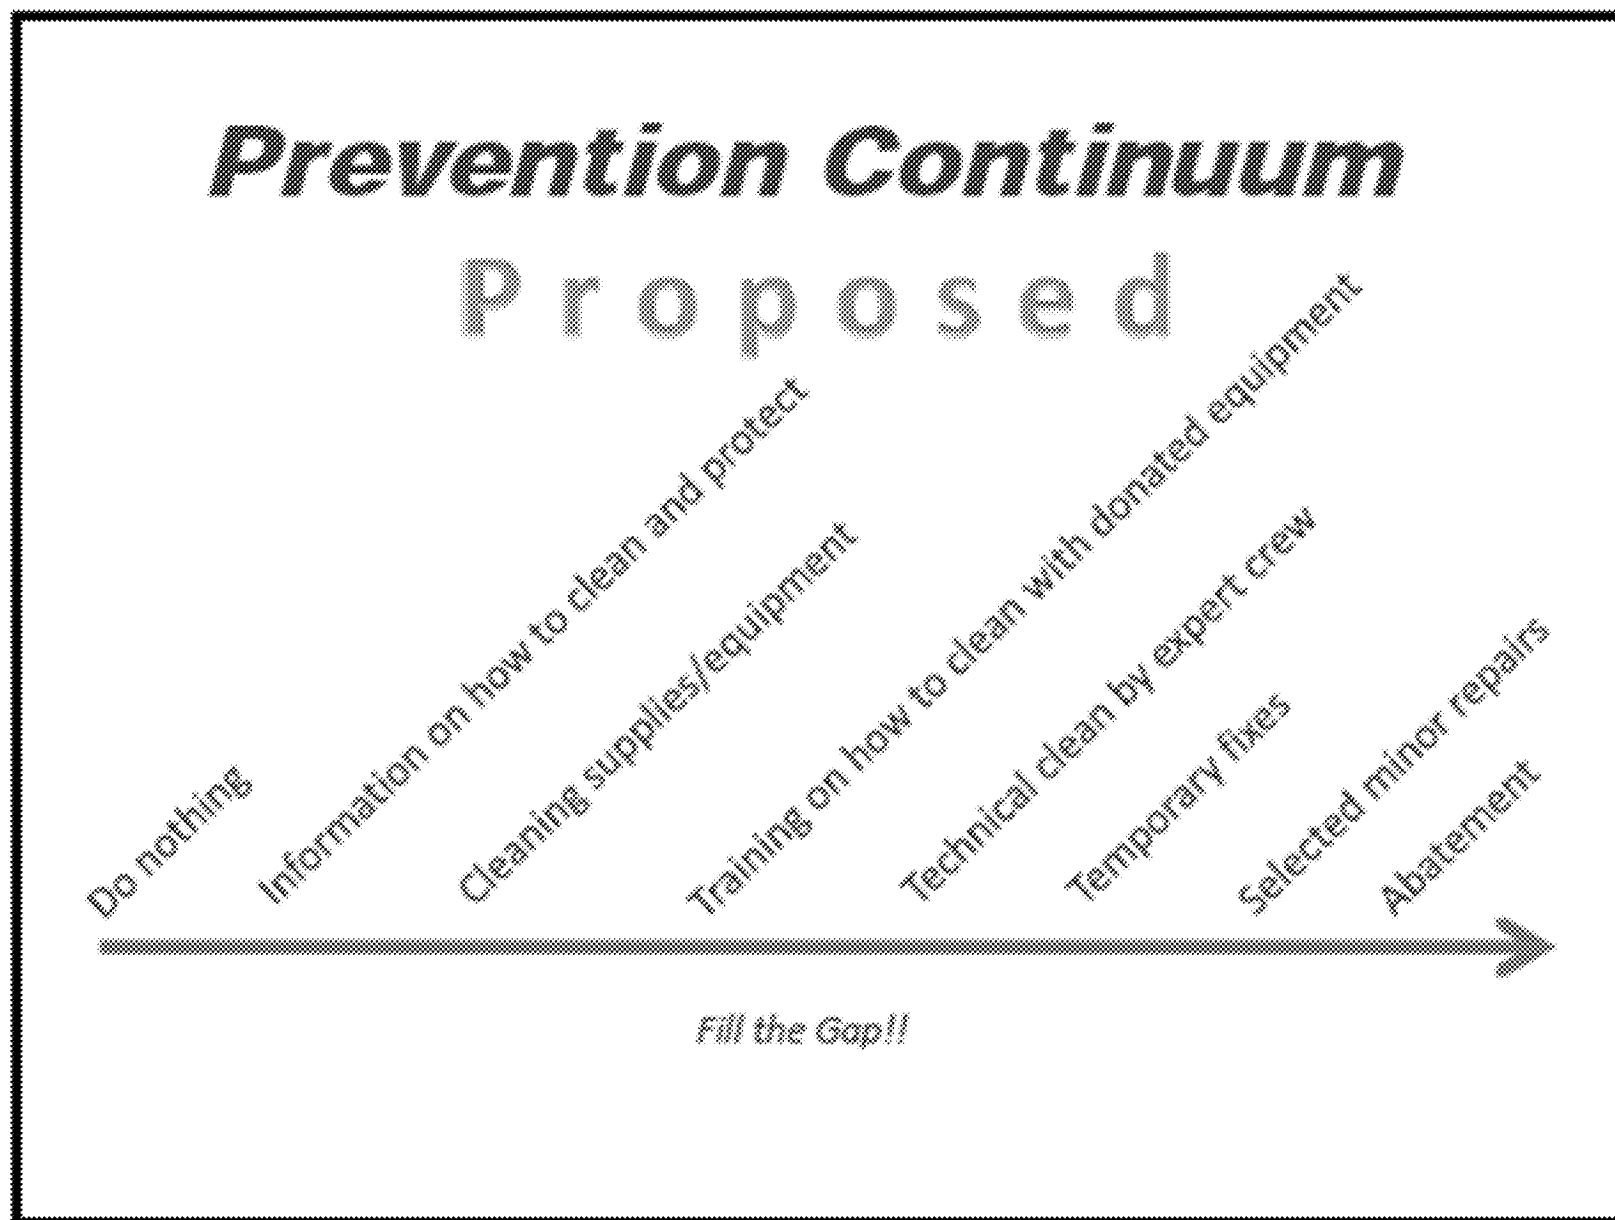

# Challenges/Implications

- Very little funding or infrastructure for **PREVENTION** of lead cases.
  - Physicians are not compensated for additional expectations.
  - A few communities have time-limited EPA/HUD funds.
  - CLPPP released \$177,500 in prevention funding to 8 communities; it's a start.
  - Abatement \$\$ helps prevent lead poisoning, but is costly and not available to all.
  - There are lots of missed opportunities to address lead hazards; need to fill the gap between doing nothing and abating a home.

# Missed Opportunities

# Challenges/Implications

- MDCH does not have a clear, cohesive vision or approach to addressing childhood lead poisoning prevention across MCH and Environmental Health.
- For example:
  - A strategic approach for abating/repairing homes for pregnant women; this approach dramatically reduced lead poisoning in Philadelphia.
  - Duplication of effort; Division of Environmental Health applying for a grant that includes developing education materials, which CLPPP is already working on.

# Opportunities/Next Steps

- New CDC grant opportunity for CLPPP; submitted on 7/21/14, potential start date of 9/1/14. Requested approx. \$440,000/year for 3 years.
  - Grant must focus on using Surveillance to drive program activities.
  - Adds Coordinator and Communications support.
  - Implements grant program for Lead Care machines in high need/low testing areas, implemented by working with Medicaid Health Plans.
  - Adds evaluation and CQI for CLPPP/Surveillance activities.

# Opportunities/Next Steps

Proposed internal MDCH activities related to infrastructure:

1. Work with MSA and MHPs to establish a whole new/different infrastructure for responding to positive test results (5  $\mu\text{g}/\text{dL}$  & up).
2. Work with MSA regarding possible Medicaid policy changes in Local Public Health chapter (increased reimbursement? Increased nursing visits?).
3. CDC grant will pick up some existing program costs. CLPPP would like to look at funding CHWs in highest need communities to engage in prevention activities. We would like to look at using our GF for this purpose, and open up the possibility of drawing additional Medicaid matching funds.
4. Develop cohesive MDCH vision and coordinated activities.

# Opportunities/Next Steps

Ongoing activities external to MDCH:

- Collaborating with MCMCH and their Pew/Kresge grant, which is exploring a healthy homes screening for Home Visitors.
